

which is involved in regulation of transcription at NFE2 sites. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAFK. The function of MAFK has been established by previous studies. The developmentally regulated expression of the globin genes depends on upstream regulatory elements termed locus control regions (LCRs). LCRs are associated with powerful enhancer activity that is mediated by the transcription factor NFE2 (nuclear factor erythroid-2). NFE2 recognition sites are also present in the gene promoters of 2 heme biosynthetic enzymes, porphobilinogen deaminase (PBGD; 176000) and ferrochelatase (FECH; 177000). NFE2 DNA-binding activity consists of a heterodimer containing an 18-kD Maf protein (MafF, MafG (OMIM Ref. No. 602020), or MafK) and p45 (OMIM Ref. No. 601490). Both subunits are members of the activator protein-1 superfamily of basic leucine zipper (bZip) proteins (see OMIM Ref. No. 165160). Maf homodimers suppress transcription at NFE2 sites. Toki et al. (1997) isolated a cDNA encoding human MAFK. The MAFK gene encodes a 156-amino acid polypeptide which is widely expressed, with highest levels seen in heart, placenta, skeletal muscle, and kidney. Toki

et al. (1997) showed that MAFK could heterodimerize not only with p45, but also with NFE2-related factor 1 (NRF1; 163260) and NFE2-related factor 2 (OMIM Ref. No. 600492); these heterodimers bound to NFE2 sites in vitro. In vivo, MAFK/p45 and MAFK/NRF1 heterodimers stimulated transcription from NFE2 sites. Similar results were found with MAFG. Iwata et al. (1998) showed that MAFK is encoded by 3 exons spanning approximately 10 kb. By use of 2 DNA mapping panels isolated from mice of a recombinant inbred strain set, Peters and Eicher (1994) demonstrated that the ubiquitous subunit is located on mouse chromosome 5. Since this region of the mouse genome shares linkage homology with human chromosome 7q, Peters and Eicher (1994) suggested that human NFE2U is probably located on 7q. Iwata et al. (1998) used FISH to map the MAFK gene to human chromosome 7p22. Motohashi et al. (2000) found that mouse embryos expressing abundant transgene-derived Mafk died of severe anemia, while lines expressing lower levels of small Maf lived to adulthood. Megakaryocytes from the latter overexpressing lines exhibited reduced proplatelet formation and MARE (Maf recognition element)-dependent transcription, phenocopying Mafg null mice (see OMIM Ref. No. Shavit et al.

(1998)). When the Mafg null mice were bred to small Maf-overexpressing transgenic animals, both loss- and gain-of-function phenotypes were reversed

[51974] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[51975] Toki, T.; Itoh, J.; Kitazawa, J.; Arai, K.; Hatakeyama, K.; Akasaka, J.; Igarashi, K.; Nomura, N.; Yokoyama, M.; Yamamoto, M.; Ito, E. : Human small Maf proteins form heterodimers with CNC family transcription factors and recognize the NF-E2 motif. *Oncogene* 14: 1901-1910, 1997. ; and

[51976] Motohashi, H.; Katsuoka, F.; Shavit, J. A.; Engel, J. D.; Yamamoto, M. : Positive or negative MARE-dependent transcriptional regulation is determined by the abundance of small Maf proteins.

[51977] Further studies establishing the function and utilities of MAFK are found in John Hopkins OMIM database record ID 600197, and in cited publications numbered 10206-10210 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM\_004571) is another VGAM1505 host target gene.

PKNOX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKNOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKNOX1 BINDING SITE, designated SEQ ID:10914, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51978] Another function of VGAM1505 is therefore inhibition of PBX/knotted 1 Homeobox 1 (PKNOX1, Accession NM\_004571), a gene which may regulate gene expression and control cell differentiation. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKNOX1. The function of PKNOX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM276.RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM\_002885) is another VGAM1505 host target gene. RAP1GA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP1GA1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP1GA1 BINDING SITE, designated SEQ ID:8795, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51979] Another function of VGAM1505 is therefore inhibition of RAP1, GTPase Activating Protein 1 (RAP1GA1, Accession NM\_002885). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP1GA1. Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM\_000322) is another VGAM1505 host target gene. RDS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RDS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:5865, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51980] Another function of VGAM1505 is therefore inhibition of Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS,

Accession NM\_000322), a gene which may function as an adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of the curvature of the rim. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDS. The function of RDS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281) is another VGAM1505 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42831, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51981] Another function of VGAM1505 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281). Accordingly, utilities of

VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A. T-cell Leukemia, Homeobox 1 (TLX1, Accession NM\_005521) is another VGAM1505 host target gene. TLX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLX1 BINDING SITE, designated SEQ ID:12046, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51982] Another function of VGAM1505 is therefore inhibition of T-cell Leukemia, Homeobox 1 (TLX1, Accession NM\_005521), a gene which controls the spleen development. Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLX1. The function of TLX1 has been established by previous studies. Kagan et al. (1987) fused human leukemic T cells carrying a t(10;14)(q24;q11) translocation with mouse leukemic T cells and examined the hybrids for genetic markers of human chromosomes 10 and 14. Hybrids containing the human 10q+ chromo-

some had the human genes for terminal deoxynucleotidyltransferase (TDT; 187410), which had been mapped to 10q23–q25, and for the constant region of TCRA (OMIM Ref. No. 186880). Hybrids containing the human 14q– chromosome retained the variable components of the TCRA gene. Thus the 14q11 breakpoint split the TCRA locus in a region between the variable and constant genes. These results suggested to Kagan et al. (1987) that the leukemic process resulted from translocation of the C(alpha) locus to a putative cellular protooncogene located proximal to the breakpoint at 10q24, with resulting deregulation of said oncogene, for which they proposed the name TCL3. Since the 10q+ chromosome retained the TDT gene, they concluded that the TDT locus is proximal to the TCL3 gene, confirming the location to band 10q23–q24. Zutter et al. (1990) cloned the t(10;14) breakpoint from CD3–negative T–cell acute lymphoblastic leukemia (T–ALL) cells. They identified a locus distinct from TDT at 10q24; this locus was not active in a variety of normal or other neoplastic T cells, but recognized an abundant 2.9–kb RNA in a t(10;14) T–cell leukemia. The authors speculated that this locus is a candidate for the putative TCL3 protooncogene. Kennedy et al. (1991)

showed that the 10q24 region encodes a homeo box gene closely related to the developmentally regulated homeotic genes of flies and mammals. The coding capacity of this activated gene, designated HOX11, was undisturbed in a T-cell line carrying the translocation t(7;10)(q35;q24). Hatano et al. (1991) identified the HOX11 gene adjacent to the breakpoint on 10q24 in the t(10;14) translocation of T-ALL. Dube et al. (1991) also implicated the HOX11 gene in the translocation t(10;14)(q24;q11) that occurs in T-ALL. The translocation juxtaposes the TCRD gene in chromosome 14q11 with a breakpoint that lies immediately centromeric of the HOX11 gene. The translocation is presumably catalyzed by recombinases normally involved in the generation of immunoglobulin and TCR diversity. Dube et al. (1991) suggested that this was the first example of a human cancer in which deregulated expression of an unaltered homeo box gene is involved in tumorigenesis. Lu et al. (1991) cloned the TCL3 gene and found that its expression was elevated in leukemic cells harboring the t(10;14) translocation. Sequence analysis confirmed that TCL3 is a homeo box-containing gene. Animal model experiments lend further support to the function of TLX1. HOX11 is an orphan homeobox gene since it is located at

a site outside the 4 mammalian HOX clusters. Whereas the orthodox HOX genes encode a combinatorial system of positional specification along the anterior–posterior axis of the embryo, the function of orphan homeobox genes is less well understood. As indicated by the findings in the translocation t(10;14), juxtaposition of HOX11 to the T-cell receptor gene redirects the expression of the normal HOX11 product to thymocytes. Transgenic mice in which HOX11 is redirected to the thymus develop T-cell lymphoblastic lymphoma–leukemia. Roberts et al. (1994) isolated a mouse Hox11 genomic clone and found that the homeodomain shared complete amino acid identity with human HOX11. The homologous mouse gene also mapped to the syntenic region within mouse chromosome 19. To assess the functional role of Hox11 in the mouse, Roberts et al. (1994) generated Hox11–deficient mice through gene targeting. Homozygous deficient mice had no spleen, but otherwise appeared normal. Hox11 is normally expressed in the splanchnic anlage arising from the splanchnic mesoderm. The homozygous deficient embryos had no cellular organization at the site of the splanchnic development, but all other splanchnic derivatives developed normally. Roberts et al. (1994) concluded

that Hox11 controls the genesis of a single organ; their finding provided new insight into the genetic regulation of morphogenesis. Dear et al. (1995) performed similar studies in 'knockout' mice and found that, in homozygous Hox11-null embryos, spleen formation commences normally up to a specific stage of embryogenesis, at which point the spleen anlage undergoes rapid and complete resorption. Dying spleen cells exhibited characteristics of apoptosis. The authors concluded that Hox11 is not required to initiate spleen development but is essential for the survival of splenic precursors during organogenesis.

[51983] It is appreciated that the abovementioned animal model for TLX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[51984] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [51985] Hatano, M.; Roberts, C. W. M.; Minden, M.; Crist, W. M.; Korsmeyer, S. J. : Deregulation of a homeobox gene, HOX11, by the t(10;14) in T cell leukemia. Science 253: 79–82, 1991. ; and
- [51986] Roberts, C. W. M.; Shutter, J. R.; Korsmeyer, S. J. : Hox11 controls the genesis of the spleen. Nature 368: 747–750, 1994.
- [51987] Further studies establishing the function and utilities of TLX1 are found in John Hopkins OMIM database record ID 186770, and in cited publications numbered 5678–5686 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Centaurin, Gamma 2 (CENTG2, Accession NM\_014914) is another VGAM1505 host target gene. CENTG2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CENTG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG2 BINDING SITE, designated SEQ ID:17155, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.
- [51988] Another function of VGAM1505 is therefore inhibition of

Centaurin, Gamma 2 (CENTG2, Accession NM\_014914). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG2. DC-TM4F2 (Accession NM\_030927) is another VGAM1505 host target gene. DC-TM4F2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DC-TM4F2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DC-TM4F2 BINDING SITE, designated SEQ ID:25196, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51989] Another function of VGAM1505 is therefore inhibition of DC-TM4F2 (Accession NM\_030927). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DC-TM4F2. DKFZP566K0524 (Accession XM\_045128) is another VGAM1505 host target gene. DKFZP566K0524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K0524, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K0524 BINDING SITE, designated SEQ ID:34372, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51990] Another function of VGAM1505 is therefore inhibition of DKFZP566K0524 (Accession XM\_045128). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K0524. KIAA0062 (Accession XM\_046677) is another VGAM1505 host target gene. KIAA0062 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0062, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0062 BINDING SITE, designated SEQ ID:34792, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51991] Another function of VGAM1505 is therefore inhibition of KIAA0062 (Accession XM\_046677). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0062. KIAA0153 (Accession NM\_015140) is another VGAM1505 host target gene. KIAA0153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0153 BINDING SITE, designated SEQ ID:17496, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51992] Another function of VGAM1505 is therefore inhibition of KIAA0153 (Accession NM\_015140). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0153. KIAA0825 (Accession XM\_027906) is another VGAM1505 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:30589, to the

nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51993] Another function of VGAM1505 is therefore inhibition of KIAA0825 (Accession XM\_027906). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. KIAA1036 (Accession NM\_014909) is another VGAM1505 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17131, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51994] Another function of VGAM1505 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. KIAA1437 (Accession XM\_026998) is another VGAM1505 host target gene. KIAA1437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1437 BINDING SITE, designated SEQ ID:30382, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51995] Another function of VGAM1505 is therefore inhibition of KIAA1437 (Accession XM\_026998). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1437. KIAA1854 (Accession XM\_049884) is another VGAM1505 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35523, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51996] Another function of VGAM1505 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities

of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. MGC11352 (Accession XM\_035941) is another VGAM1505 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32354, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51997] Another function of VGAM1505 is therefore inhibition of MGC11352 (Accession XM\_035941). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11352. MGC26954 (Accession NM\_145025) is another VGAM1505 host target gene. MGC26954 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC26954, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

MGC26954 BINDING SITE, designated SEQ ID:29639, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51998] Another function of VGAM1505 is therefore inhibition of MGC26954 (Accession NM\_145025). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC26954. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840) is another VGAM1505 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30763, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[51999] Another function of VGAM1505 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

PPP1R16B. RAB17, Member RAS Oncogene Family (RAB17, Accession NM\_022449) is another VGAM1505 host target gene. RAB17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB17 BINDING SITE, designated SEQ ID:22785, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52000] Another function of VGAM1505 is therefore inhibition of RAB17, Member RAS Oncogene Family (RAB17, Accession NM\_022449). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB17. Ring Finger Protein 38 (RNF38, Accession NM\_022781) is another VGAM1505 host target gene. RNF38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF38 BINDING SITE, des-

ignated SEQ ID:23063, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52001] Another function of VGAM1505 is therefore inhibition of Ring Finger Protein 38 (RNF38, Accession NM\_022781). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF38. SEC22C (Accession NM\_004206) is another VGAM1505 host target gene. SEC22C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC22C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC22C BINDING SITE, designated SEQ ID:10403, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52002] Another function of VGAM1505 is therefore inhibition of SEC22C (Accession NM\_004206). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC22C. LOC146520 (Accession XM\_085492) is another

VGAM1505 host target gene. LOC146520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146520 BINDING SITE, designated SEQ ID:38190, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52003] Another function of VGAM1505 is therefore inhibition of LOC146520 (Accession XM\_085492). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146520. LOC154930 (Accession XM\_088080) is another VGAM1505 host target gene. LOC154930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154930 BINDING SITE, designated SEQ ID:39503, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52004] Another function of VGAM1505 is therefore inhibition of LOC154930 (Accession XM\_088080). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154930. LOC197285 (Accession XM\_113752) is another VGAM1505 host target gene. LOC197285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197285 BINDING SITE, designated SEQ ID:42414, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52005] Another function of VGAM1505 is therefore inhibition of LOC197285 (Accession XM\_113752). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197285. LOC221584 (Accession XM\_168132) is another VGAM1505 host target gene. LOC221584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221584, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221584 BINDING SITE, designated SEQ ID:45041, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52006] Another function of VGAM1505 is therefore inhibition of LOC221584 (Accession XM\_168132). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221584. LOC253782 (Accession XM\_171023) is another VGAM1505 host target gene. LOC253782 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253782, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253782 BINDING SITE, designated SEQ ID:45796, to the nucleotide sequence of VGAM1505 RNA, herein designated VGAM RNA, also designated SEQ ID:4216.

[52007] Another function of VGAM1505 is therefore inhibition of LOC253782 (Accession XM\_171023). Accordingly, utilities of VGAM1505 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC253782. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1506 (VGAM1506) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52008] VGAM1506 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1506 was detected is described hereinabove with reference to Figs. 1–8.

[52009] VGAM1506 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52010] VGAM1506 gene encodes a VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1506 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1506 precursor RNA is designated SEQ ID:1492, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1492 is located at position 8885 relative to the genome of Aphid Lethal Paralysis Virus.

[52011] VGAM1506 precursor RNA folds onto itself, forming VGAM1506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52012] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1506 folded precursor RNA into VGAM1506 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1506 RNA is designated SEQ ID:4217, and is provided hereinbelow with reference to the sequence listing part.

[52013] VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1506 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52014] VGAM1506 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1506 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1506 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52015] The complementary binding of VGAM1506 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1506 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1506 host target RNA into VGAM1506 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52016] It is appreciated that VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1506 host target genes. The mRNA of each one of this plurality of VGAM1506 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1506 RNA, herein designated VGAM RNA, and which when bound by VGAM1506 RNA causes

inhibition of translation of respective one or more VGAM1506 host target proteins.

[52017] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1506 gene, herein designated VGAM GENE, on one or more VGAM1506 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52018] It is yet further appreciated that a function of VGAM1506 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1506 include diagnosis, prevention and

treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1506 correlate with, and may be deduced from, the identity of the host target genes which VGAM1506 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52019] Nucleotide sequences of the VGAM1506 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1506 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1506 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1506 are further described hereinbelow with reference to Table 1.

[52020] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1506 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1506 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52021] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1506 gene, herein designated VGAM is inhibition of expression of VGAM1506 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1506 correlate with, and may be deduced from, the identity of the target genes which VGAM1506 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52022] Chloride Channel 3 (CLCN3, Accession NM\_001829) is a VGAM1506 host target gene. CLCN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLCN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN3 BINDING SITE, designated SEQ ID:7567, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52023] A function of VGAM1506 is therefore inhibition of Chloride Channel 3 (CLCN3, Accession NM\_001829), a gene which play a role in the neural cell function through regulation of membrane excitability. Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN3. The function of CLCN3 and its association with various diseases and clinical conditions, has been established by

previous studies, as described hereinabove with reference to VGAM1332.CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM\_001310) is another VGAM1506 host target gene. CREBL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CREBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:6995, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52024] Another function of VGAM1506 is therefore inhibition of CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM\_001310). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2. CRIPT (Accession XM\_057669) is another VGAM1506 host target gene. CRIPT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRIPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of CRIPT BINDING SITE, designated SEQ ID:36539, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52025] Another function of VGAM1506 is therefore inhibition of CRIPT (Accession XM\_057669). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRIPT. FLJ10989 (Accession NM\_018292) is another VGAM1506 host target gene. FLJ10989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10989 BINDING SITE, designated SEQ ID:20282, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52026] Another function of VGAM1506 is therefore inhibition of FLJ10989 (Accession NM\_018292). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10989. FLJ22794 (Accession XM\_166220) is another

VGAM1506 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44025, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52027] Another function of VGAM1506 is therefore inhibition of FLJ22794 (Accession XM\_166220). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. KIAA0445 (Accession NM\_014675) is another VGAM1506 host target gene. KIAA0445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0445 BINDING SITE, designated SEQ ID:16145, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52028] Another function of VGAM1506 is therefore inhibition of KIAA0445 (Accession NM\_014675). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0445. MGC12760 (Accession NM\_032723) is another VGAM1506 host target gene. MGC12760 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC12760, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12760 BINDING SITE, designated SEQ ID:26447, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52029] Another function of VGAM1506 is therefore inhibition of MGC12760 (Accession NM\_032723). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12760. Protein-O-mannosyltransferase 1 (POMT1, Accession NM\_007171) is another VGAM1506 host target gene. POMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POMT1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:14019, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52030] Another function of VGAM1506 is therefore inhibition of Protein-O-mannosyltransferase 1 (POMT1, Accession NM\_007171). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1. LOC144266 (Accession XM\_084795) is another VGAM1506 host target gene. LOC144266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144266 BINDING SITE, designated SEQ ID:37711, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52031] Another function of VGAM1506 is therefore inhibition of LOC144266 (Accession XM\_084795). Accordingly, utilities

of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144266. LOC149579 (Accession XM\_048743) is another VGAM1506 host target gene. LOC149579 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149579 BINDING SITE, designated SEQ ID:35241, to the nucleotide sequence of VGAM1506 RNA, herein designated VGAM RNA, also designated SEQ ID:4217.

[52032] Another function of VGAM1506 is therefore inhibition of LOC149579 (Accession XM\_048743). Accordingly, utilities of VGAM1506 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149579. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1507 (VGAM1507) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52033] VGAM1507 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1507 was detected is described hereinabove with reference to Figs. 1–8.

[52034] VGAM1507 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Aphid Lethal Paralysis Virus. VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52035] VGAM1507 gene encodes a VGAM1507 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1507 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1507 precursor RNA is designated SEQ ID:1493, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1493 is located at position 4389 relative to the genome of Aphid Lethal Paralysis Virus.

[52036] VGAM1507 precursor RNA folds onto itself, forming VGAM1507 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52037] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1507 folded precursor RNA into VGAM1507 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1507 RNA is designated SEQ ID:4218, and is provided hereinbelow with reference to the sequence listing part.

[52038] VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1507 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[52039] VGAM1507 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1507 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1507 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52040] The complementary binding of VGAM1507 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1507 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1507 host target RNA into VGAM1507 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52041] It is appreciated that VGAM1507 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1507 host target genes. The mRNA of each one of this plurality of VGAM1507 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1507 RNA, herein designated VGAM RNA, and which when bound by VGAM1507 RNA causes inhibition of translation of respective one or more VGAM1507 host target proteins.

[52042] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1507 gene, herein designated VGAM GENE, on one or more VGAM1507 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52043] It is yet further appreciated that a function of VGAM1507 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of viral infection by Aphid Lethal Paralysis Virus. Specific functions, and accordingly utilities, of VGAM1507 correlate with, and may be deduced from, the identity of the host target genes which VGAM1507 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52044] Nucleotide sequences of the VGAM1507 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1507 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1507 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1507 are further  
described hereinbelow with reference to Table 1.

[52045] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1507 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1507 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[52046] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1507 gene, herein designated VGAM is  
inhibition of expression of VGAM1507 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1507 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1507  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[52047] C-type (calcium dependent, carbohydrate-recognition do-  
main) Lectin, Superfamily Member 5 (CLECSF5, Accession

NM\_013252) is a VGAM1507 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14921, to the nucleotide sequence of VGAM1507 RNA, herein designated VGAM RNA, also designated SEQ ID:4218.

[52048] A function of VGAM1507 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM\_033535) is another VGAM1507 host target gene. FBXL5 BINDING SITE1 and FBXL5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXL5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FBXL5 BINDING SITE1 and FBXL5 BINDING SITE2, designated SEQ ID:27302 and SEQ ID:14460 respectively, to the nucleotide sequence of VGAM1507 RNA, herein designated VGAM RNA, also designated SEQ ID:4218.

[52049] Another function of VGAM1507 is therefore inhibition of F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM\_033535), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL5. The function of FBXL5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM61. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793) is another VGAM1507 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2,

designated SEQ ID:6453 and SEQ ID:15163 respectively, to the nucleotide sequence of VGAM1507 RNA, herein designated VGAM RNA, also designated SEQ ID:4218.

[52050] Another function of VGAM1507 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793). Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM\_088733) is another VGAM1507 host target gene. RAB40A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RAB40A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB40A BINDING SITE, designated SEQ ID:39926, to the nucleotide sequence of VGAM1507 RNA, herein designated VGAM RNA, also designated SEQ ID:4218.

[52051] Another function of VGAM1507 is therefore inhibition of RAB40A, Member RAS Oncogene Family (RAB40A, Accession XM\_088733). Accordingly, utilities of VGAM1507 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB40A. Fig. 1 further

provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1508 (VGAM1508) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52052] VGAM1508 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1508 was detected is described hereinabove with reference to Figs. 1–8.

[52053] VGAM1508 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus V. VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52054] VGAM1508 gene encodes a VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1508 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1508 precursor RNA is designated SEQ ID:1494, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1494 is located at position 7772 relative to the genome of Potato Virus V.

[52055] VGAM1508 precursor RNA folds onto itself, forming VGAM1508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52056] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1508 folded precursor RNA into VGAM1508 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1508 RNA is designated SEQ ID:4219, and is provided hereinbelow with reference to the sequence listing part.

[52057] VGAM1508 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1508 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52058] VGAM1508 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1508 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1508 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1508 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[52059] The complementary binding of VGAM1508 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1508 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1508 host target RNA into VGAM1508 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52060] It is appreciated that VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1508 host target genes. The mRNA of each one of this plurality of VGAM1508 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1508 RNA, herein designated VGAM RNA, and which when bound by VGAM1508 RNA causes inhibition of translation of respective one or more

VGAM1508 host target proteins.

[52061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1508 gene, herein designated VGAM GENE, on one or more VGAM1508 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52062] It is yet further appreciated that a function of VGAM1508 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of viral infection by Potato Virus V. Specific

functions, and accordingly utilities, of VGAM1508 correlate with, and may be deduced from, the identity of the host target genes which VGAM1508 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52063] Nucleotide sequences of the VGAM1508 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1508 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1508 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1508 are further described hereinbelow with reference to Table 1.

[52064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1508 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1508 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52065] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1508 gene, herein designated VGAM is inhibition of expression of VGAM1508 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1508 correlate with, and may be deduced from, the identity of the target genes which VGAM1508 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52066] Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104) is a VGAM1508 host target gene. BACE BINDING SITE1 and BACE BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BACE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACE BINDING SITE1 and BACE BINDING SITE2, designated SEQ ID:14419 and SEQ ID:29087 respectively, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52067] A function of VGAM1508 is therefore inhibition of Beta-site APP-cleaving Enzyme (BACE, Accession NM\_012104), a gene which is responsible for the proteolytic processing of the amyloid precursor protein. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACE. The function of BACE and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM173.DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892) is another VGAM1508 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13762, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52068] Another function of VGAM1508 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280.Fibromodulin (FMOD, Accession

NM\_002023) is another VGAM1508 host target gene.

FMOD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMOD BINDING SITE, designated SEQ ID:7770, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52069] Another function of VGAM1508 is therefore inhibition of Fibromodulin (FMOD, Accession NM\_002023), a gene which affects the rate of fibrils formation. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMOD. The function of FMOD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM39. Growth Arrest-specific 1 (GAS1, Accession NM\_002048) is another VGAM1508 host target gene. GAS1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of GAS1 BINDING SITE, designated SEQ ID:7799, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52070] Another function of VGAM1508 is therefore inhibition of Growth Arrest-specific 1 (GAS1, Accession NM\_002048), a gene which blocks entry to S phase and prevents cycling of normal and transformed cells and thereby is a putative tumor suppressor gene.. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAS1. The function of GAS1 has been established by previous studies. Growth arrest-specific genes were cloned from mRNAs unique to quiescent, serum-starved NIH 3T3 mouse fibroblasts (Schneider et al., 1988). Webb et al. (1992) mapped the Gas-1 gene to mouse chromosome 13 by in situ hybridization. Colombo et al. (1992) showed linkage of Gas-1 to markers on mouse chromosome 13 in a region that contains 8 loci that are conserved in human 5q, mainly 5q11-q14. Gas-1 is close to the IL9 gene (OMIM Ref. No. 146931), for example. On this basis, Webb et al. (1992) predicted that the GAS1 gene in man is located on 5q. However, the prediction proved not to be

true. Evdokiou et al. (1993) localized the human GAS1 gene to 9q21.3–q22 by tritium–labeled in situ hybridization. DNA from human–rodent somatic cell hybrids was used to verify the location of GAS1 to human chromosome 9. They stated that GAS1 was the first gene to be mapped to both human chromosome 9 and mouse chromosome 13. The location of GAS1 at a site of deletion in myeloid malignancies, together with the demonstration that GAS1 suppresses DNA synthesis, suggested that it is a tumor suppressor gene. Del Sal et al. (1994) demonstrated that overexpression of the human GAS1 gene is able to block cell proliferation in lung and bladder carcinoma cell lines, but not in an osteosarcoma cell line or in an adenovirus–type–5 transformed cell line. Del Sal et al. (1992) had previously shown that simian virus 40–transformed NIH 3T3 cells are also refractory to murine GAS1 overexpression, suggesting that the retinoblastoma and/or p53 gene products have an active role in mediating the growth–suppressing effect of GAS1. By in situ hybridization, Del Sal et al. (1994) mapped the GAS1 gene to 9q21.3–q22.1 in a region considered to be a fragile site. Observations suggesting involvement of this area in bladder carcinoma were cited.

[52071] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52072] Del Sal, G.; Ruaro, M. E.; Philipson, L.; Schneider, C. : The growth arrest-specific gene, *gas1*, is involved in growth suppression. *Cell* 70: 595–607, 1992. ; and

[52073] Schneider, C.; King, R. M.; Philipson, L. : Genes specifically expressed at growth arrest of mammalian cells. *Cell* 54: 787–793, 1988.

[52074] Further studies establishing the function and utilities of GAS1 are found in John Hopkins OMIM database record ID 139185, and in cited publications numbered 2188–2193 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM\_002073) is another VGAM1508 host target gene. GNAZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAZ BINDING SITE, designated SEQ ID:7846, to the nucleotide sequence of VGAM1508 RNA, herein

designated VGAM RNA, also designated SEQ ID:4219.

[52075] Another function of VGAM1508 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Z Polypeptide (GNAZ, Accession NM\_002073), a gene which functions as modulator or transducer in various trans-membrane signaling systems. Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAZ. The function of GNAZ has been established by previous studies. By cDNA cloning, Blatt et al. (1988) identified a G protein-encoding gene which they called G(z-alpha) and symbolized GNAZ. The corresponding protein was found to differ strikingly from other G-alpha subunits in amino acid sequence in a number of regions, and it appeared to be highly enriched in neural tissue (Fong et al., 1988; Matsuoka et al., 1988). Blatt et al. (1988) assigned the GNAZ locus to chromosome 22 by hybridization to the DNA from a panel of rodent-human cell hybrids. By in situ hybridization, Wilkie et al. (1992) demonstrated that the GNAZ gene is located in band 22q11. By the analysis of RFLVs in an interspecific backcross, they showed that the corresponding gene is located on mouse chromosome 10. Budarf et al. (1991) further narrowed the localization to

22q11.2 by fluorescence in situ hybridization on reverse banded metaphase chromosomes. They confirmed the localization by means of a regional mapping panel of somatic cell hybrids.

[52076] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52077] Blatt, C.; Eversole-Cire, P.; Cohn, V. H.; Zollman, S.; Fournier, R. E. K.; Mohandas, L. T.; Nesbitt, M.; Lugo, T.; Jones, D. T.; Reed, R. R.; Weiner, L. P.; Sparkes, R. S.; Simon, M. I. : Chromosomal localization of genes encoding guanine nucleotide-binding protein subunits in mouse and human. Proc. Nat. Acad. Sci. 85: 7642-7646, 1988. ; and

[52078] Wilkie, T. M.; Gilbert, D. J.; Olsen, A. S.; Chen, X.-N.; Amatruda, T. T.; Korenberg, J. R.; Trask, B. J.; de Jong, P.; Reed, R. R.; Simon, M. I.; Jenkins, N. A.; Copeland, N. G. : Evolu.

[52079] Further studies establishing the function and utilities of GNAZ are found in John Hopkins OMIM database record ID 139160, and in cited publications numbered 474 and 2184-2186 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM\_166287) is another VGAM1508 host target gene.

ACAA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ACAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACAA2 BINDING SITE, designated SEQ ID:44095, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52080] Another function of VGAM1508 is therefore inhibition of Acetyl-Coenzyme A Acyltransferase 2 (mitochondrial 3-oxoacyl-Coenzyme A thiolase) (ACAA2, Accession XM\_166287). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACAA2. Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409) is another VGAM1508 host target gene. CCR6 BINDING SITE1 and CCR6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR6, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR6 BINDING SITE1 and CCR6 BINDING SITE2, designated SEQ ID:25369 and SEQ ID:10576 respectively, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52081] Another function of VGAM1508 is therefore inhibition of Chemokine (C-C motif) Receptor 6 (CCR6, Accession NM\_031409). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR6. FLJ20034 (Accession NM\_017630) is another VGAM1508 host target gene. FLJ20034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20034 BINDING SITE, designated SEQ ID:19133, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52082] Another function of VGAM1508 is therefore inhibition of FLJ20034 (Accession NM\_017630). Accordingly, utilities of

VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20034. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1508 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8915, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52083] Another function of VGAM1508 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. MGC35558 (Accession NM\_145013) is another VGAM1508 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29616, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52084] Another function of VGAM1508 is therefore inhibition of MGC35558 (Accession NM\_145013). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM\_013257) is another VGAM1508 host target gene. SGKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGKL BINDING SITE, designated SEQ ID:14926, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52085] Another function of VGAM1508 is therefore inhibition of Serum/glucocorticoid Regulated Kinase-like (SGKL, Accession NM\_013257). Accordingly, utilities of VGAM1508 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with SGKL. Synaptotagmin XIII (SYT13, Accession XM\_167880) is another VGAM1508 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44890, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52086] Another function of VGAM1508 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM\_167880). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. LOC197358 (Accession XM\_113872) is another VGAM1508 host target gene. LOC197358 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC197358 BINDING SITE, designated SEQ ID:42512, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52087] Another function of VGAM1508 is therefore inhibition of LOC197358 (Accession XM\_113872). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197358. LOC256230 (Accession XM\_173371) is another VGAM1508 host target gene. LOC256230 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256230, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256230 BINDING SITE, designated SEQ ID:46540, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52088] Another function of VGAM1508 is therefore inhibition of LOC256230 (Accession XM\_173371). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256230. LOC256231 (Accession XM\_173372) is an-

other VGAM1508 host target gene. LOC256231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256231 BINDING SITE, designated SEQ ID:46542, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52089] Another function of VGAM1508 is therefore inhibition of LOC256231 (Accession XM\_173372). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256231. LOC92539 (Accession XM\_045632) is another VGAM1508 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34501, to the nucleotide sequence of VGAM1508 RNA, herein designated VGAM RNA, also designated SEQ ID:4219.

[52090] Another function of VGAM1508 is therefore inhibition of LOC92539 (Accession XM\_045632). Accordingly, utilities of VGAM1508 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1509 (VGAM1509) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52091] VGAM1509 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1509 was detected is described hereinabove with reference to Figs. 1–8.

[52092] VGAM1509 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus V. VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52093] VGAM1509 gene encodes a VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1509 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1509 precursor RNA is designated SEQ ID:1495, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1495 is located at position 8444 relative to the genome of Potato Virus V.

[52094] VGAM1509 precursor RNA folds onto itself, forming VGAM1509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52095] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1509 folded precursor RNA into VGAM1509 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1509 RNA is designated SEQ ID:4220, and is provided hereinbelow with reference to the sequence listing part.

[52096] VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1509 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52097] VGAM1509 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1509 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1509 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52098] The complementary binding of VGAM1509 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1509 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1509 host target RNA into VGAM1509 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52099] It is appreciated that VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1509 host target genes. The mRNA of each one of this plurality of VGAM1509 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1509 RNA, herein designated VGAM RNA, and which when bound by VGAM1509 RNA causes inhibition of translation of respective one or more VGAM1509 host target proteins.

[52100] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1509 gene, herein designated VGAM GENE, on one or more VGAM1509 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52101] It is yet further appreciated that a function of VGAM1509 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1509 include diagnosis, prevention and treatment of viral infection by Potato Virus V. Specific functions, and accordingly utilities, of VGAM1509 correlate with, and may be deduced from, the identity of the host target genes which VGAM1509 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52102] Nucleotide sequences of the VGAM1509 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1509 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1509 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1509 are further described hereinbelow with reference to Table 1.

[52103] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1509 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1509 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[52104] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1509 gene, herein designated VGAM is inhibition of expression of VGAM1509 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1509 correlate with, and may be deduced from, the identity of the target genes which VGAM1509 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52105] Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM\_002731) is a VGAM1509 host target gene. PRKACB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKACB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKACB BINDING SITE, designated SEQ ID:8601, to the nucleotide sequence of VGAM1509 RNA, herein designated VGAM RNA, also designated SEQ ID:4220.

[52106] A function of VGAM1509 is therefore inhibition of Protein Kinase, CAMP-dependent, Catalytic, Beta (PRKACB, Accession NM\_002731), a gene which is the catalytic beta sub-

unit of cAMP-dependent protein kinase (PKA). Accordingly, utilities of VGAM1509 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKACB. The function of PRKACB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM795. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1510 (VGAM1510) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52107] VGAM1510 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1510 was detected is described hereinabove with reference to Figs. 1–8.

[52108] VGAM1510 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus V.

VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52109] VGAM1510 gene encodes a VGAM1510 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1510 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1510 precursor RNA is designated SEQ ID:1496, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1496 is located at position 6444 relative to the genome of Potato Virus V.

[52110] VGAM1510 precursor RNA folds onto itself, forming VGAM1510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52111] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1510 folded precursor RNA into VGAM1510 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM1510 RNA is designated SEQ ID:4221, and is provided hereinbelow with reference to the sequence listing part.

[52112] VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1510 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52113] VGAM1510 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1510 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1510 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52114] The complementary binding of VGAM1510 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1510 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1510 host target RNA into VGAM1510 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52115] It is appreciated that VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1510 host target genes. The mRNA of each one of this plurality of VGAM1510 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1510 RNA, herein designated VGAM RNA, and which when bound by VGAM1510 RNA causes inhibition of translation of respective one or more VGAM1510 host target proteins.

[52116] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1510 gene, herein designated VGAM GENE, on one or more VGAM1510 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[52117] It is yet further appreciated that a function of VGAM1510 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of viral infection by Potato Virus V. Specific functions, and accordingly utilities, of VGAM1510 correlate with, and may be deduced from, the identity of the host target genes which VGAM1510 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52118] Nucleotide sequences of the VGAM1510 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1510 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1510 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1510 are further described hereinbelow with reference to Table 1.

[52119] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1510 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1510 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52120] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1510 gene, herein designated VGAM is inhibition of expression of VGAM1510 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1510 correlate with, and may be deduced from, the identity of the target genes which VGAM1510 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52121] Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM\_000723) is a VGAM1510 host target gene. CACNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNB1 BINDING SITE, designated SEQ ID:6387, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52122] A function of VGAM1510 is therefore inhibition of Calcium

Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM\_000723), a gene which may not only play an important role in the transport/insertion of the alpha-1S subunit into the membrane. Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNB1. The function of CACNB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM114. inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536) is another VGAM1510 host target gene. IMPA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPA1 BINDING SITE, designated SEQ ID:12055, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52123] Another function of VGAM1510 is therefore inhibition of inositol(myo)-1(or 4)-monophosphatase 1 (IMPA1, Accession NM\_005536), a gene which is responsible for the

provision of inositol required for synthesis of phosphatidylinositol and polyphosphoinositides. Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPA1. The function of IMPA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM134. Tuftelin 1 (TUFT1, Accession NM\_020127) is another VGAM1510 host target gene. TUFT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TUFT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TUFT1 BINDING SITE, designated SEQ ID:21319, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52124] Another function of VGAM1510 is therefore inhibition of Tuftelin 1 (TUFT1, Accession NM\_020127), a gene which appears to play a role in cytokinesis, cell shape, and specialized functions such as secretion and capping. Accordingly, utilities of VGAM1510 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with TUFT1. The function of TUFT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1152.MGC13138

(Accession NM\_033410) is another VGAM1510 host target gene. MGC13138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13138 BINDING SITE, designated SEQ ID:27233, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52125] Another function of VGAM1510 is therefore inhibition of MGC13138 (Accession NM\_033410). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13138. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM\_013401) is another VGAM1510 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15065, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52126] Another function of VGAM1510 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM\_013401). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958) is another VGAM1510 host target gene. RNF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF8 BINDING SITE, designated SEQ ID:10099, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52127] Another function of VGAM1510 is therefore inhibition of

Ring Finger Protein (C3HC4 type) 8 (RNF8, Accession NM\_003958). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF8. Zinc Finger Protein 323 (ZNF323, Accession NM\_030899) is another VGAM1510 host target gene. ZNF323 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:25170, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52128] Another function of VGAM1510 is therefore inhibition of Zinc Finger Protein 323 (ZNF323, Accession NM\_030899). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323. LOC201965 (Accession XM\_114412) is another VGAM1510 host target gene. LOC201965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201965, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE, designated SEQ ID:42935, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52129] Another function of VGAM1510 is therefore inhibition of LOC201965 (Accession XM\_114412). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201965. LOC51696 (Accession NM\_016217) is another VGAM1510 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18315, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52130] Another function of VGAM1510 is therefore inhibition of LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC51696. LOC93349 (Accession NM\_138402) is another VGAM1510 host target gene. LOC93349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93349 BINDING SITE, designated SEQ ID:28771, to the nucleotide sequence of VGAM1510 RNA, herein designated VGAM RNA, also designated SEQ ID:4221.

[52131] Another function of VGAM1510 is therefore inhibition of LOC93349 (Accession NM\_138402). Accordingly, utilities of VGAM1510 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93349. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1511 (VGAM1511) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52132] VGAM1511 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1511 was detected is described hereinabove with reference to Figs. 1–8.

[52133] VGAM1511 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Potato Virus V.

VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52134] VGAM1511 gene encodes a VGAM1511 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1511 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1511 precursor RNA is designated SEQ ID:1497, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1497 is located at position 4177 relative to the genome of Potato Virus V.

[52135] VGAM1511 precursor RNA folds onto itself, forming VGAM1511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52136] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1511 folded precursor RNA into VGAM1511 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1511 RNA is designated SEQ ID:4222, and is provided hereinbelow with reference to the sequence listing part.

[52137] VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1511 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52138] VGAM1511 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1511 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1511 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52139] The complementary binding of VGAM1511 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1511 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1511 host target RNA into VGAM1511 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52140] It is appreciated that VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1511 host target genes. The mRNA of each one of this plurality of VGAM1511 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1511 RNA, herein designated VGAM RNA, and which when bound by VGAM1511 RNA causes inhibition of translation of respective one or more VGAM1511 host target proteins.

[52141] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1511 gene, herein designated VGAM GENE, on one or more VGAM1511 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52142] It is yet further appreciated that a function of VGAM1511 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of viral infection by Potato Virus V. Specific functions, and accordingly utilities, of VGAM1511 correlate with, and may be deduced from, the identity of the host target genes which VGAM1511 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52143] Nucleotide sequences of the VGAM1511 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1511 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1511 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1511 are further described hereinbelow with reference to Table 1.

[52144] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1511 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1511 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52145] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1511 gene, herein designated VGAM is inhibition of expression of VGAM1511 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1511 correlate with, and may be deduced from, the identity of the target genes which VGAM1511 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52146] Natural Killer-tumor Recognition Sequence (NKTR, Accession NM\_005385) is a VGAM1511 host target gene. NKTR BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by NKTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKTR BINDING SITE, designated SEQ ID:11864, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52147] A function of VGAM1511 is therefore inhibition of Natural Killer-tumor Recognition Sequence (NKTR, Accession NM\_005385), a gene which is involved in the function of nk cells. Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKTR. The function of NKTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM133. Oxytocin Receptor (OXTR, Accession NM\_000916) is another VGAM1511 host target gene. OXTR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE,

designated SEQ ID:6621, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52148] Another function of VGAM1511 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM\_000916), a gene which induces inward ion currents. Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The function of OXTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636. Cerebellin 1 Precursor (CBLN1, Accession NM\_004352) is another VGAM1511 host target gene. CBLN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBLN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLN1 BINDING SITE, designated SEQ ID:10554, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52149] Another function of VGAM1511 is therefore inhibition of

Cerebellin 1 Precursor (CBLN1, Accession NM\_004352). Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLN1. HSPC063 (Accession NM\_014155) is another VGAM1511 host target gene. HSPC063 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC063 BINDING SITE, designated SEQ ID:15437, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52150] Another function of VGAM1511 is therefore inhibition of HSPC063 (Accession NM\_014155). Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC063. KIAA1871 (Accession XM\_028409) is another VGAM1511 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30699, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52151] Another function of VGAM1511 is therefore inhibition of KIAA1871 (Accession XM\_028409). Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. Rab11-FIP2 (Accession NM\_014904) is another VGAM1511 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17098, to the nucleotide sequence of VGAM1511 RNA, herein designated VGAM RNA, also designated SEQ ID:4222.

[52152] Another function of VGAM1511 is therefore inhibition of Rab11-FIP2 (Accession NM\_014904). Accordingly, utilities of VGAM1511 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

Rab11–FIP2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1512 (VGAM1512) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52153] VGAM1512 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1512 was detected is described hereinabove with reference to Figs. 1–8.

[52154] VGAM1512 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52155] VGAM1512 gene encodes a VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1512 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1512 precursor RNA is designated SEQ ID:1498, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1498 is located at position 7608 relative to the genome of Parsnip Yellow Fleck Virus.

- [52156] VGAM1512 precursor RNA folds onto itself, forming VGAM1512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52157] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1512 folded precursor RNA into VGAM1512 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1512 RNA is designated SEQ ID:4223, and is provided hereinbelow with reference to the sequence listing part.

[52158] VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1512 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52159] VGAM1512 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1512 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1512 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52160] The complementary binding of VGAM1512 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1512 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1512 host target RNA into VGAM1512 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52161] It is appreciated that VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1512 host target genes. The mRNA of each one of this plurality of VGAM1512 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1512 RNA, herein designated VGAM RNA, and which when bound by VGAM1512 RNA causes

inhibition of translation of respective one or more VGAM1512 host target proteins.

[52162] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1512 gene, herein designated VGAM GENE, on one or more VGAM1512 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52163] It is yet further appreciated that a function of VGAM1512 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1512 include diagnosis, prevention and

treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM1512 correlate with, and may be deduced from, the identity of the host target genes which VGAM1512 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52164] Nucleotide sequences of the VGAM1512 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1512 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1512 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1512 are further described hereinbelow with reference to Table 1.

[52165] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1512 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1512 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52166] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1512 gene, herein designated VGAM is inhibition of expression of VGAM1512 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1512 correlate with, and may be deduced from, the identity of the target genes which VGAM1512 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52167] Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_130436) is a VGAM1512 host target gene. DYRK1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DYRK1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK1A BINDING SITE, designated SEQ ID:28184, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52168] A function of VGAM1512 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 1A (DYRK1A, Accession NM\_130436), a gene which regulates cell proliferation and may be involved in brain development . Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK1A. The function of

DYRK1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM42. Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347) is another VGAM1512 host target gene. LZTFL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTFL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTFL1 BINDING SITE, designated SEQ ID:21600, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52169] Another function of VGAM1512 is therefore inhibition of Leucine Zipper Transcription Factor-like 1 (LZTFL1, Accession NM\_020347). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTFL1. Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999) is another VGAM1512 host target gene. SDC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDC4, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDC4 BINDING SITE, designated SEQ ID:8889, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52170] Another function of VGAM1512 is therefore inhibition of Syndecan 4 (amphiglycan, ryudocan) (SDC4, Accession NM\_002999), a gene which is a cell surface proteoglycan. Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDC4. The function of SDC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Serum Deprivation Response (phosphatidylserine binding protein) (SDPR, Accession NM\_004657) is another VGAM1512 host target gene. SDPR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDPR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDPR BINDING SITE, designated SEQ ID:11024,

to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52171] Another function of VGAM1512 is therefore inhibition of Serum Deprivation Response (phosphatidylserine binding protein) (SDPR, Accession NM\_004657), a gene which substrate for protein\_kinase\_C ( assists in localizing PKC to invaginations of the plasma membrane. Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDPR. The function of SDPR has been established by previous studies. Gustincich et al. (1999) cloned SDPR from a human liver cDNA library using the murine homolog cloned by Gustincich and Schneider (1993) as probe. The SDPR cDNA encodes a deduced 425-amino acid peptide with a calculated molecular mass of 47.2 kD. The human and mouse proteins share 84% sequence identity; both contain a leucine zipper-like domain with 7 repeats and 2 putative protein kinase C phosphorylation sites. Northern blot analysis of various human tissues showed nearly ubiquitous expression of a 3.1-kb transcript, which was always coexpressed with a shorter transcript. Highest expression was detected in heart and lung. Gustincich et al. (1999) also found that SDPR mRNA was

detectable in asynchronously growing human fibroblast cells and was significantly upregulated after serum deprivation but not after density-dependent growth inhibition. Gustincich et al. (1999) determined that SDPR is the same as PS-p68, a phosphatidylserine-binding protein purified from human platelets by Burgener et al. (1990). SDPR localizes to the cytoplasm (Burgener et al., 1990; Gustincich et al., 1999). Using in vitro translation of histidine-tagged recombinant SDPR, Gustincich et al. (1999) found that SDPR is able to bind PS liposomes in a calcium-independent manner. Burgener et al. (1990) identified SDPR as the major PS-binding protein in platelets. They also found that SDPR was able to bind PKC in a cell-free assay in the presence of PS and calcium, resulting in SDPR phosphorylation.

[52172] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52173] Burgener, R.; Wolf, M.; Ganz, T.; Baggiolini, M. : Purification and characterization of a major phosphatidylserine-binding phosphoprotein from human platelets. *Biochem. J.* 269: 729-734, 1990. ; and

[52174] Gustincich, S.; Vatta, P.; Goruppi, S.; Wolf, M.; Saccone, S.;

Della Valle, G.; Baggiolini, M.; Schneider, C. : The human serum deprivation response gene (SDPR) maps to 2q32–q33 and cod.

[52175] Further studies establishing the function and utilities of SDPR are found in John Hopkins OMIM database record ID 606728, and in cited publications numbered 742–744 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calpain 6 (CAPN6, Accession NM\_014289) is another VGAM1512 host target gene. CAPN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:15568, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52176] Another function of VGAM1512 is therefore inhibition of Calpain 6 (CAPN6, Accession NM\_014289). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6. HERV-H LTR-associating 2 (HHLA2, Acces-

sion NM\_007072) is another VGAM1512 host target gene. HHLA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HHLA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HHLA2 BINDING SITE, designated SEQ ID:13935, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52177] Another function of VGAM1512 is therefore inhibition of HERV-H LTR-associating 2 (HHLA2, Accession NM\_007072). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HHLA2. Integrin, Alpha 10 (ITGA10, Accession XM\_002097) is another VGAM1512 host target gene. ITGA10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITGA10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGA10 BINDING SITE, designated SEQ ID:29863, to the nucleotide sequence of

VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52178] Another function of VGAM1512 is therefore inhibition of Integrin, Alpha 10 (ITGA10, Accession XM\_002097). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA10. SIMRP7 (Accession XM\_166462) is another VGAM1512 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44370, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52179] Another function of VGAM1512 is therefore inhibition of SIMRP7 (Accession XM\_166462). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. LOC145497 (Accession XM\_085150) is another VGAM1512 host target gene. LOC145497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC145497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145497 BINDING SITE, designated SEQ ID:37873, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52180] Another function of VGAM1512 is therefore inhibition of LOC145497 (Accession XM\_085150). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145497. LOC153469 (Accession XM\_087681) is another VGAM1512 host target gene. LOC153469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153469 BINDING SITE, designated SEQ ID:39378, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52181] Another function of VGAM1512 is therefore inhibition of LOC153469 (Accession XM\_087681). Accordingly, utilities

of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153469. LOC220766 (Accession XM\_165471) is another VGAM1512 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43654, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52182] Another function of VGAM1512 is therefore inhibition of LOC220766 (Accession XM\_165471). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC221431 (Accession XM\_166380) is another VGAM1512 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221431 BINDING SITE, designated SEQ ID:44222, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52183] Another function of VGAM1512 is therefore inhibition of LOC221431 (Accession XM\_166380). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC222787 (Accession XM\_169879) is another VGAM1512 host target gene. LOC222787 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222787, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222787 BINDING SITE, designated SEQ ID:45304, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52184] Another function of VGAM1512 is therefore inhibition of LOC222787 (Accession XM\_169879). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222787. LOC257396 (Accession XM\_173148) is another VGAM1512 host target gene. LOC257396 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257396, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257396 BINDING SITE, designated SEQ ID:46406, to the nucleotide sequence of VGAM1512 RNA, herein designated VGAM RNA, also designated SEQ ID:4223.

[52185] Another function of VGAM1512 is therefore inhibition of LOC257396 (Accession XM\_173148). Accordingly, utilities of VGAM1512 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257396. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1513 (VGAM1513) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52186] VGAM1513 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1513 was detected is described hereinabove with reference to Figs. 1-8.

[52187] VGAM1513 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52188] VGAM1513 gene encodes a VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1513 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1513 precursor RNA is designated SEQ ID:1499, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1499 is located at position 3 relative to the genome of Parsnip Yellow Fleck Virus.

[52189] VGAM1513 precursor RNA folds onto itself, forming VGAM1513 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[52190] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1513 folded precursor RNA into VGAM1513 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM1513 RNA is designated SEQ ID:4224, and is provided hereinbelow with reference to the sequence listing part.

[52191] VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1513 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52192] VGAM1513 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1513 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1513 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1513 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52193] The complementary binding of VGAM1513 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1513 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1513 host target RNA into VGAM1513 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52194] It is appreciated that VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1513 host target genes. The mRNA of each one of this plurality of VGAM1513 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1513 RNA, herein designated VGAM RNA, and which when bound by VGAM1513 RNA causes inhibition of translation of respective one or more VGAM1513 host target proteins.

[52195] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1513 gene, herein designated VGAM GENE, on one or more VGAM1513 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52196] It is yet further appreciated that a function of VGAM1513 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM1513 correlate with, and may be deduced from, the identity of the host target genes which VGAM1513 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52197] Nucleotide sequences of the VGAM1513 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1513 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1513 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1513 are further described hereinbelow with reference to Table 1.

[52198] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1513 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1513 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52199] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1513 gene, herein designated VGAM is inhibition of expression of VGAM1513 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1513 correlate with, and may be deduced from, the identity of the target genes which VGAM1513 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52200] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM\_003783) is a VGAM1513 host target gene. B3GALT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by B3GALT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT2 BINDING SITE, designated SEQ ID:9868, to the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, also designated SEQ ID:4224.

[52201] A function of VGAM1513 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 2 (B3GALT2, Accession NM\_003783). Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT2. DXS1283E (Accession XM\_047871) is another VGAM1513 host target gene. DXS1283E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DXS1283E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DXS1283E BINDING SITE, designated SEQ ID:35059, to the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, also designated SEQ ID:4224.

[52202] Another function of VGAM1513 is therefore inhibition of DXS1283E (Accession XM\_047871). Accordingly, utilities of VGAM1513 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DXS1283E. DKFZp434N074 (Accession XM\_031481) is another VGAM1513 host target gene. DKFZp434N074 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp434N074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434N074 BINDING SITE, designated SEQ ID:31388, to the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, also designated SEQ ID:4224.

[52203] Another function of VGAM1513 is therefore inhibition of DKFZp434N074 (Accession XM\_031481). Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434N074. FLJ10759 (Accession NM\_018207) is another VGAM1513 host target gene. FLJ10759 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

FLJ10759 BINDING SITE, designated SEQ ID:20098, to the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, also designated SEQ ID:4224.

[52204] Another function of VGAM1513 is therefore inhibition of FLJ10759 (Accession NM\_018207). Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759. LOC153561 (Accession XM\_087708) is another VGAM1513 host target gene. LOC153561 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153561 BINDING SITE, designated SEQ ID:39400, to the nucleotide sequence of VGAM1513 RNA, herein designated VGAM RNA, also designated SEQ ID:4224.

[52205] Another function of VGAM1513 is therefore inhibition of LOC153561 (Accession XM\_087708). Accordingly, utilities of VGAM1513 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153561. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1514 (VGAM1514) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52206] VGAM1514 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1514 was detected is described hereinabove with reference to Figs. 1–8.

[52207] VGAM1514 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52208] VGAM1514 gene encodes a VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1514 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1514 precursor RNA is designated SEQ ID:1500, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1500 is located at position 9392 relative to the

genome of Parsnip Yellow Fleck Virus.

[52209] VGAM1514 precursor RNA folds onto itself, forming VGAM1514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52210] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1514 folded precursor RNA into VGAM1514 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1514 RNA is designated SEQ ID:4225, and is provided hereinbelow with reference to the sequence listing part.

[52211] VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1514 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52212] VGAM1514 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1514 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1514 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52213] The complementary binding of VGAM1514 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1514 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1514 host target RNA into VGAM1514 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52214] It is appreciated that VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1514 host target genes. The mRNA of each one of this plurality of VGAM1514 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1514 RNA, herein designated VGAM RNA, and which when bound by VGAM1514 RNA causes inhibition of translation of respective one or more VGAM1514 host target proteins.

[52215] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1514 gene, herein designated VGAM GENE, on one or more VGAM1514 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52216] It is yet further appreciated that a function of VGAM1514 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM1514

correlate with, and may be deduced from, the identity of the host target genes which VGAM1514 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52217] Nucleotide sequences of the VGAM1514 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1514 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1514 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1514 are further described hereinbelow with reference to Table 1.

[52218] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1514 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1514 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52219] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1514 gene, herein designated VGAM is inhibition of expression of VGAM1514 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1514 correlate with, and may be deduced

from, the identity of the target genes which VGAM1514 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52220] Basonuclin (BNC, Accession NM\_001717) is a VGAM1514 host target gene. BNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNC BINDING SITE, designated SEQ ID:7450, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52221] A function of VGAM1514 is therefore inhibition of Basonuclin (BNC, Accession NM\_001717), a gene which plays a role in the maintenance of proliferative capacity and prevention of terminal differentiation of keratinocytes. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNC. The function of BNC has been established by previous studies. Basonuclin (BNC) is a protein found mainly in cells of the basal layer of stratified squamous epithelia. Tseng and Green (1992) isolated a

cDNA encoding this protein from mRNA of cultured human keratinocytes. The basonuclin cDNA encodes a 993-amino acid polypeptide that is located in the nucleus and contains 6 zinc finger motifs of the C2H2 class, as in known transcription factors. Basonuclin is expressed in cells that are able to undergo division but are not necessarily in the division cycle; the protein is not found in terminally differentiated cells (Tseng and Green, 1994). These properties suggested that basonuclin performs a transcriptional regulatory function related to promotion of keratinocyte growth or suppression of keratinocyte differentiation. Teumer et al. (1997) cloned and sequenced the basonuclin gene from a human genomic library. By analysis of human/rodent hybrid cells, they mapped it to chromosome 15. The transcription unit spans nearly 29 kb of sequence. The coding region is distributed over 5 exons and the 3 pairs of zinc fingers encoded by the last 2 exons. The 5-prime flanking sequence and first exon are unusually rich in GC content and in CpG dinucleotides. This sequence region contains numerous binding sites for the transcription factor Sp1 (OMIM Ref. No. 189906).

[52222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[52223] Tseng, H.; Green, H. : Basonuclin: a keratinocyte protein with multiple paired zinc fingers. Proc. Nat. Acad. Sci. 89: 10311–10315, 1992. ; and

[52224] Tseng, H.; Green, H. : Association of basonuclin with ability of keratinocytes to multiply and with absence of terminal differentiation. J. Cell Biol. 126: 495–506, 1994.

[52225] Further studies establishing the function and utilities of BNC are found in John Hopkins OMIM database record ID 601930, and in cited publications numbered 6253–6255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Necdin Homolog (mouse) (NDN, Accession NM\_002487) is another VGAM1514 host target gene. NDN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDN BINDING SITE, designated SEQ ID:8312, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52226] Another function of VGAM1514 is therefore inhibition of

Necdin Homolog (mouse) (NDN, Accession NM\_002487), a gene which facilitates the entry of the cell into cell cycle arrest. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDN. The function of NDN has been established by previous studies. Reasoning that additional imprinted genes may lie within the Prader-Willi syndrome (PWS; 176270) deletion interval 15q11-q13, MacDonald and Wevrick (1997) searched for transcribed sequences in the region between the 2 imprinted genes ZNF127 (MKRN3; 603856) and SNRPN (OMIM Ref. No. 182279). An expressed sequence tag (EST) showed 99% sequence identity to the 3-prime end of a GenBank sequence (OMIM Ref. No. U35139), defined as 'a human necdin-related protein mRNA.' They concluded that the putative necdin-encoding gene is a single locus in proximal 15q, as determined by radiation hybrid mapping, localization of the appropriate PCR-amplified fragments to overlapping YACs, and absence in other YACs from the PWS deletion region. Mouse necdin (gene locus Ndn) was originally identified by Maruyama et al. (1991) as a protein encoded by a neural differentiation-specific mRNA, derived from embryonal carcinoma cells. The necdin protein

is localized to the nuclei of postmitotic neurons and is expressed in almost all postmitotic neurons in the CNS from the beginning of neural differentiation and into adult life. The *Ndn* locus is present as a single exon in the mouse genome and was mapped to mouse chromosome 7 in a region of conserved synteny with human 15q11–q13 by MacDonald and Wevrick (1997) using genetic mapping in an interspecific backcross panel. They demonstrated, furthermore, that expression of the *Ndn* mouse gene and the *NDN* human gene is limited to the paternal allele, with highest levels of expression in brain and placenta. Consistent with the observation that imprinted genes have few and small introns (Hurst et al., 1996), human *NDN* is contained within a single exon, like its mouse ortholog. They suggested that loss of *necdin* gene expression may contribute to the disorder of brain development in individuals with PWS. Jay et al. (1997) likewise cloned a human cDNA with close similarities to the mouse *necdin* gene. They mapped the *NDN* gene to 15q11–q13 by fluorescence in situ hybridization (FISH), and confirmed the location by PCR analysis of DNA extracted from a panel of hamster/human somatic cell hybrids. Both approaches suggested that the *NDN* gene maps to 15q11–q13 but that a homologous

gene or pseudogene maps to 12q21. Jay et al. (1997) also mapped NDN by hybridization to a YAC contig covering the PWS critical region. They suggested that NDN is located approximately 100 kb distal to ZNF127 and 1 to 1.5 Mb proximal to SNRPN. NDN displayed several characteristics of an imprinted locus, including allelic DNA methylation and an asynchronous DNA replication. Jay et al. (1997) found a complete lack of NDN expression in PWS brain and fibroblasts, indicating that the gene is expressed exclusively from the paternal allele in these tissues and suggesting a possible role of this gene in PWS.

[52227] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52228] Hurst, L. D.; McVean, G.; Moore, T. : Imprinted genes have few and small introns. (Letter) Nature Genet. 12: 234–237, 1996. ; and

[52229] Jay, P.; Rougeulle, C.; Massacrier, A.; Moncla, A.; Mattei, M.–G.; Malzac, P.; Roeckel, N.; Taviaux, S.; Lefranc, J.–L. B.; Cau, P.; Berta, P.; Lalande, M.; Muscatelli, F. : The human n.

[52230] Further studies establishing the function and utilities of NDN are found in John Hopkins OMIM database record ID

602117, and in cited publications numbered 8921–8930 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Oligodendrocyte Lineage Transcription Factor 2 (OLIG2, Accession NM\_005806) is another VGAM1514 host target gene. OLIG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLIG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLIG2 BINDING SITE, designated SEQ ID:12382, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52231] Another function of VGAM1514 is therefore inhibition of Oligodendrocyte Lineage Transcription Factor 2 (OLIG2, Accession NM\_005806), a gene which may bind DNA and contains a helix–loop–helix DNA–binding domain. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLIG2. The function of OLIG2 has been established by previous studies. The oligodendrocyte lineage transcription factors OLIG1 (OMIM Ref. No. 606385)

and OLIG2, originally identified in rodents, encode basic helix–loop–helix transcription factors. In the rodent central nervous system, they are expressed exclusively in oligodendrocytes and oligodendrocyte precursors (Lu et al., 2000; Zhou et al., 2000). Pursuing the suggestion that novel molecular markers might be found among factors that have roles in glial development (Raff et al., 1983), Lu et al. (2001) found that the human OLIG1/2 genes are expressed strongly in oligodendroglioma, contrasting absent or low expression in astrocytoma. Their study provided evidence that neoplastic cells of oligodendroglioma resemble oligodendrocytes or their progenitor cells and may derive from cells of this lineage. Animal model experiments lend further support to the function of OLIG2. In Olig1/2 double–mutant mice, Zhou and Anderson (2002) found that motoneurons were largely eliminated, and oligodendrocyte differentiation was abolished. Lineage tracing data suggested that Olig1/2  $-/-$  pMN progenitors instead generated V2 interneurons and then astrocytes. This apparent conversion likely reflects independent roles for OLIG1/2 in specifying motoneuron and oligodendrocyte fates. OLIG genes therefore couple neuronal and glial subtype specification, unlike proneural bHLH factors that

control the neuron versus glia decision. The authors concluded that, in the spinal cord, OLIG and proneural genes comprise a combinatorial code for the specification of neurons, astrocytes, and oligodendrocytes, the 3 fundamental cell types of the central nervous system.

[52232] It is appreciated that the abovementioned animal model for OLIG2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[52233] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52234] Lu, Q. R.; Park, J. K.; Noll, E.; Chan, J. A.; Alberta, J.; Yuk, D.; Alzamora, M. G.; Louis, D. N.; Stiles, C. D.; Rowitch, D. H.; Black, P. M. : Oligodendrocyte lineage genes (OLIG) as molecular markers for human glial brain tumors. Proc. Nat. Acad. Sci. 98: 10851–10856, 2001. ; and

[52235] Zhou, Q.; Anderson, D. J. : The bHLH transcription factors OLIG2 and OLIG1 couple neuronal and glial subtype specification. Cell 109: 61–73, 2002.

[52236] Further studies establishing the function and utilities of OLIG2 are found in John Hopkins OMIM database record ID 606386, and in cited publications numbered 647 and

6585–6589 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAS Guanyl Releasing Protein 1 (calcium and DAG–regulated) (RASGRP1, Accession NM\_005739) is another VGAM1514 host target gene. RASGRP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RASGRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRP1 BINDING SITE, designated SEQ ID:12302, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52237] Another function of VGAM1514 is therefore inhibition of RAS Guanyl Releasing Protein 1 (calcium and DAG–regulated) (RASGRP1, Accession NM\_005739). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRP1. SNL (Accession NM\_003088) is another VGAM1514 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9064, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52238] Another function of VGAM1514 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675. Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM\_003392) is another VGAM1514 host target gene. WNT5A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by WNT5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT5A BINDING SITE, designated SEQ ID:9429, to the nucleotide se-

quence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52239] Another function of VGAM1514 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 5A (WNT5A, Accession NM\_003392), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and is probably a developmental protein. Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT5A. The function of WNT5A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM996. Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995) is another VGAM1514 host target gene. BTN2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN2A2 BINDING SITE, designated SEQ ID:13859, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ

ID:4225.

[52240] Another function of VGAM1514 is therefore inhibition of Butyrophilin, Subfamily 2, Member A2 (BTN2A2, Accession NM\_006995). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN2A2. Chromosome 17 Open Reading Frame 1A (C17orf1A, Accession NM\_006382) is another VGAM1514 host target gene. C17orf1A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C17orf1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf1A BINDING SITE, designated SEQ ID:13086, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52241] Another function of VGAM1514 is therefore inhibition of Chromosome 17 Open Reading Frame 1A (C17orf1A, Accession NM\_006382). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C17orf1A. Calcium-binding tyrosine-(Y)-phosphorylation Regulated

(fibrousheathin 2) (CABYR, Accession NM\_012189) is another VGAM1514 host target gene. CABYR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CABYR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABYR BINDING SITE, designated SEQ ID:14477, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52242] Another function of VGAM1514 is therefore inhibition of Calcium-binding tyrosine-(Y)-phosphorylation Regulated (fibrousheathin 2) (CABYR, Accession NM\_012189). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABYR. CD36L1 (Accession NM\_005505) is another VGAM1514 host target gene. CD36L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD36L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD36L1 BINDING SITE, designated SEQ ID:12019, to the

nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52243] Another function of VGAM1514 is therefore inhibition of CD36L1 (Accession NM\_005505). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD36L1. CGI-01 (Accession NM\_015935) is another VGAM1514 host target gene. CGI-01 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGI-01, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGI-01 BINDING SITE, designated SEQ ID:18055, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52244] Another function of VGAM1514 is therefore inhibition of CGI-01 (Accession NM\_015935). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGI-01. DKFZp434C0328 (Accession NM\_017577) is another VGAM1514 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19014, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52245] Another function of VGAM1514 is therefore inhibition of DKFZp434C0328 (Accession NM\_017577). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. FLJ11588 (Accession NM\_024603) is another VGAM1514 host target gene. FLJ11588 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11588, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11588 BINDING SITE, designated SEQ ID:23853, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52246] Another function of VGAM1514 is therefore inhibition of

FLJ11588 (Accession NM\_024603). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11588. FLJ12838 (Accession NM\_024641) is another VGAM1514 host target gene. FLJ12838 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12838, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12838 BINDING SITE, designated SEQ ID:23923, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52247] Another function of VGAM1514 is therefore inhibition of FLJ12838 (Accession NM\_024641). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12838. FLJ20400 (Accession XM\_039306) is another VGAM1514 host target gene. FLJ20400 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

complementarity of the nucleotide sequences of FLJ20400 BINDING SITE, designated SEQ ID:33044, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52248] Another function of VGAM1514 is therefore inhibition of FLJ20400 (Accession XM\_039306). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20400. KIAA0638 (Accession XM\_051489) is another VGAM1514 host target gene. KIAA0638 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0638, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0638 BINDING SITE, designated SEQ ID:35846, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52249] Another function of VGAM1514 is therefore inhibition of KIAA0638 (Accession XM\_051489). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0638. KIAA0894 (Accession NM\_014896) is another

VGAM1514 host target gene. KIAA0894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0894 BINDING SITE, designated SEQ ID:17057, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52250] Another function of VGAM1514 is therefore inhibition of KIAA0894 (Accession NM\_014896). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0894. KIAA1204 (Accession XM\_045011) is another VGAM1514 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:34315, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52251] Another function of VGAM1514 is therefore inhibition of KIAA1204 (Accession XM\_045011). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. Leucine-rich Repeat LGI Family, Member 4 (LGI4, Accession NM\_139284) is another VGAM1514 host target gene. LGI4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LGI4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LGI4 BINDING SITE, designated SEQ ID:29288, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52252] Another function of VGAM1514 is therefore inhibition of Leucine-rich Repeat LGI Family, Member 4 (LGI4, Accession NM\_139284). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LGI4. MGC4172 (Accession NM\_024308) is another VGAM1514 host target gene. MGC4172 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by MGC4172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4172 BINDING SITE, designated SEQ ID:23598, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52253] Another function of VGAM1514 is therefore inhibition of MGC4172 (Accession NM\_024308). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4172. MIDORI (Accession XM\_057651) is another VGAM1514 host target gene. MIDORI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MIDORI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MIDORI BINDING SITE, designated SEQ ID:36529, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52254] Another function of VGAM1514 is therefore inhibition of MIDORI (Accession XM\_057651). Accordingly, utilities of

VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MI-DORI. ZF5128 (Accession NM\_014347) is another VGAM1514 host target gene. ZF5128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZF5128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZF5128 BINDING SITE, designated SEQ ID:15671, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52255] Another function of VGAM1514 is therefore inhibition of ZF5128 (Accession NM\_014347). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZF5128. LOC145989 (Accession XM\_004815) is another VGAM1514 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC145989 BINDING SITE, designated SEQ ID:29952, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52256] Another function of VGAM1514 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC148195 (Accession XM\_097419) is another VGAM1514 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:40877, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52257] Another function of VGAM1514 is therefore inhibition of LOC148195 (Accession XM\_097419). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. LOC158714 (Accession XM\_088650) is another VGAM1514 host target gene. LOC158714 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158714 BINDING SITE, designated SEQ ID:39885, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52258] Another function of VGAM1514 is therefore inhibition of LOC158714 (Accession XM\_088650). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158714. LOC257407 (Accession XM\_173078) is another VGAM1514 host target gene. LOC257407 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257407 BINDING SITE, designated SEQ ID:46336, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52259] Another function of VGAM1514 is therefore inhibition of

LOC257407 (Accession XM\_173078). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257407. LOC91115 (Accession XM\_036218) is another VGAM1514 host target gene. LOC91115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE, designated SEQ ID:32397, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52260] Another function of VGAM1514 is therefore inhibition of LOC91115 (Accession XM\_036218). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. LOC92305 (Accession NM\_138385) is another VGAM1514 host target gene. LOC92305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC92305 BINDING SITE, designated SEQ ID:28759, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52261] Another function of VGAM1514 is therefore inhibition of LOC92305 (Accession NM\_138385). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92305. LOC92997 (Accession XM\_048690) is another VGAM1514 host target gene. LOC92997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92997 BINDING SITE, designated SEQ ID:35221, to the nucleotide sequence of VGAM1514 RNA, herein designated VGAM RNA, also designated SEQ ID:4225.

[52262] Another function of VGAM1514 is therefore inhibition of LOC92997 (Accession XM\_048690). Accordingly, utilities of VGAM1514 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92997. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1515 (VGAM1515) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52263] VGAM1515 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1515 was detected is described hereinabove with reference to Figs. 1–8.

[52264] VGAM1515 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52265] VGAM1515 gene encodes a VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1515 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1515 precursor RNA is designated SEQ ID:1501, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1501 is located at position 2895 relative to the genome of Parsnip Yellow Fleck Virus.

[52266] VGAM1515 precursor RNA folds onto itself, forming VGAM1515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1515 folded precursor RNA into VGAM1515 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM1515 RNA is designated SEQ ID:4226, and is provided hereinbelow with reference to the sequence listing part.

[52268] VGAM1515 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1515 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52269] VGAM1515 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1515 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1515 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1515 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52270] The complementary binding of VGAM1515 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1515 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1515 host target RNA into VGAM1515 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52271] It is appreciated that VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1515 host target genes. The mRNA of each one of this plurality of VGAM1515 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1515 RNA, herein designated VGAM RNA, and which when bound by VGAM1515 RNA causes inhibition of translation of respective one or more

VGAM1515 host target proteins.

[52272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1515 gene, herein designated VGAM GENE, on one or more VGAM1515 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52273] It is yet further appreciated that a function of VGAM1515 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus.

Specific functions, and accordingly utilities, of VGAM1515 correlate with, and may be deduced from, the identity of the host target genes which VGAM1515 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52274] Nucleotide sequences of the VGAM1515 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1515 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1515 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1515 are further described hereinbelow with reference to Table 1.

[52275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1515 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1515 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52276] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1515 gene, herein designated VGAM is inhibition of expression of VGAM1515 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1515 correlate with, and may be deduced from, the identity of the target genes which VGAM1515 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52277] Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801) is a VGAM1515 host target gene. JAM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM3 BINDING SITE, designated SEQ ID:26557, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52278] A function of VGAM1515 is therefore inhibition of Junctional Adhesion Molecule 3 (JAM3, Accession NM\_032801), a gene which is a member of the junctional adhesion molecule protein family. Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM3. The function of JAM3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM200. Matrilin 3 (MATN3, Accession NM\_002381) is another VGAM1515 host target gene. MATN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MATN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATN3 BINDING SITE, designated SEQ ID:8198, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52279] Another function of VGAM1515 is therefore inhibition of Matrilin 3 (MATN3, Accession NM\_002381). Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MATN3. Zinc Finger Protein 278 (ZNF278, Accession NM\_014323) is another VGAM1515 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3, design-

nated SEQ ID:15623, SEQ ID:25772 and SEQ ID:25781 respectively, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52280] Another function of VGAM1515 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM\_014323), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM414.HSMPP8 (Accession XM\_167894) is another VGAM1515 host target gene. HSMPP8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSMPP8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSMPP8 BINDING SITE, designated SEQ ID:44902, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52281] Another function of VGAM1515 is therefore inhibition of HSMPP8 (Accession XM\_167894). Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSMPP8. TERF1 (TRF1)–interacting Nuclear Factor 2 (TINF2, Accession NM\_012461) is another VGAM1515 host target gene. TINF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TINF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TINF2 BINDING SITE, designated SEQ ID:14834, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52282] Another function of VGAM1515 is therefore inhibition of TERF1 (TRF1)–interacting Nuclear Factor 2 (TINF2, Accession NM\_012461). Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TINF2. LOC154386 (Accession XM\_087920) is another VGAM1515 host target gene. LOC154386 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC154386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154386 BINDING SITE, designated SEQ ID:39473, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52283] Another function of VGAM1515 is therefore inhibition of LOC154386 (Accession XM\_087920). Accordingly, utilities of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154386. LOC256158 (Accession XM\_175125) is another VGAM1515 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46637, to the nucleotide sequence of VGAM1515 RNA, herein designated VGAM RNA, also designated SEQ ID:4226.

[52284] Another function of VGAM1515 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities

of VGAM1515 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1516 (VGAM1516) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52285] VGAM1516 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1516 was detected is described hereinabove with reference to Figs. 1-8.

[52286] VGAM1516 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Parsnip Yellow Fleck Virus. VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52287] VGAM1516 gene encodes a VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1516 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1516 precursor RNA is designated SEQ ID:1502, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1502 is located at position 1828 relative to the genome of Parsnip Yellow Fleck Virus.

[52288] VGAM1516 precursor RNA folds onto itself, forming VGAM1516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52289] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1516 folded precursor RNA into VGAM1516 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM1516 RNA is designated SEQ ID:4227, and

is provided hereinbelow with reference to the sequence listing part.

[52290] VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1516 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[52291] VGAM1516 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1516 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1516 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52292] The complementary binding of VGAM1516 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1516 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1516 host target RNA into VGAM1516 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52293] It is appreciated that VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1516 host target genes. The mRNA of each one of this plurality of VGAM1516 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1516 RNA, herein designated VGAM RNA, and which when bound by VGAM1516 RNA causes inhibition of translation of respective one or more VGAM1516 host target proteins.

[52294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1516 gene, herein designated VGAM GENE, on one or more VGAM1516 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52295] It is yet further appreciated that a function of VGAM1516 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of viral infection by Parsnip Yellow Fleck Virus. Specific functions, and accordingly utilities, of VGAM1516 correlate with, and may be deduced from, the identity of the host target genes which VGAM1516 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52296] Nucleotide sequences of the VGAM1516 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1516 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1516 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1516 are further described hereinbelow with reference to Table 1.

[52297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1516 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1516 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52298] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1516 gene, herein designated VGAM is inhibition of expression of VGAM1516 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1516 correlate with, and may be deduced from, the identity of the target genes which VGAM1516 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52299] Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621) is a VGAM1516 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:10979, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52300] A function of VGAM1516 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM\_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701) is another VGAM1516 host target gene. ASB13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASB13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASB13 BINDING SITE, designated SEQ ID:24014, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52301] Another function of VGAM1516 is therefore inhibition of Ankyrin Repeat and SOCS Box-containing 13 (ASB13, Accession NM\_024701). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASB13. CUB and Sushi Multiple Domains 1 (CSMD1, Accession NM\_033225) is another VGAM1516 host target gene. CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2 are HOST TARGET bind-

ing sites found in untranslated regions of mRNA encoded by CSMD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSMD1 BINDING SITE1 and CSMD1 BINDING SITE2, designated SEQ ID:27071 and SEQ ID:36194 respectively, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52302] Another function of VGAM1516 is therefore inhibition of CUB and Sushi Multiple Domains 1 (CSMD1, Accession NM\_033225). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSMD1. Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM\_012259) is another VGAM1516 host target gene. HEY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEY2 BINDING SITE, designated SEQ ID:14566, to the nucleotide sequence of VGAM1516 RNA, herein

designated VGAM RNA, also designated SEQ ID:4227.

[52303] Another function of VGAM1516 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif 2 (HEY2, Accession NM\_012259). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEY2. KIAA1944 (Accession XM\_062545) is another VGAM1516 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37230, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52304] Another function of VGAM1516 is therefore inhibition of KIAA1944 (Accession XM\_062545). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1944. KIAA1956 (Accession XM\_085836) is another VGAM1516 host target gene. KIAA1956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1956 BINDING SITE, designated SEQ ID:38362, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52305] Another function of VGAM1516 is therefore inhibition of KIAA1956 (Accession XM\_085836). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1956. Protein Phosphatase 4, Regulatory Subunit 2 (PPP4R2, Accession NM\_019853) is another VGAM1516 host target gene. PPP4R2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PPP4R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R2 BINDING SITE, designated SEQ ID:21257, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52306] Another function of VGAM1516 is therefore inhibition of

Protein Phosphatase 4, Regulatory Subunit 2 (PPP4R2, Accession NM\_019853). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R2.

LOC155438 (Accession XM\_098722) is another VGAM1516 host target gene. LOC155438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155438 BINDING SITE, designated SEQ ID:41769, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52307] Another function of VGAM1516 is therefore inhibition of LOC155438 (Accession XM\_098722). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155438. LOC200854 (Accession XM\_113396) is another VGAM1516 host target gene. LOC200854 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200854, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200854 BINDING SITE, designated SEQ ID:42253, to the nucleotide sequence of VGAM1516 RNA, herein designated VGAM RNA, also designated SEQ ID:4227.

[52308] Another function of VGAM1516 is therefore inhibition of LOC200854 (Accession XM\_113396). Accordingly, utilities of VGAM1516 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200854. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1517 (VGAM1517) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52309] VGAM1517 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1517 was detected is described hereinabove with reference to Figs. 1-8.

[52310] VGAM1517 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea Seed-borne Mosaic Virus. VGAM1517 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52311] VGAM1517 gene encodes a VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1517 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1517 precursor RNA is designated SEQ ID:1503, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1503 is located at position 6741 relative to the genome of Pea Seed-borne Mosaic Virus.

[52312] VGAM1517 precursor RNA folds onto itself, forming VGAM1517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52313] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1517 folded precursor RNA into VGAM1517

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1517 RNA is designated SEQ ID:4228, and is provided hereinbelow with reference to the sequence listing part.

[52314] VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1517 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52315] VGAM1517 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1517 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1517 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52316] The complementary binding of VGAM1517 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1517 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1517 host target RNA into VGAM1517 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[52317] It is appreciated that VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1517 host target genes. The mRNA of each one of this plurality of VGAM1517 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1517 RNA, herein designated VGAM RNA, and which when bound by VGAM1517 RNA causes inhibition of translation of respective one or more VGAM1517 host target proteins.

[52318] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1517 gene, herein designated VGAM GENE, on one or more VGAM1517 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52319] It is yet further appreciated that a function of VGAM1517 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of viral infection by Pea Seed-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1517 correlate with, and may be deduced from, the identity of the host target genes which VGAM1517 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52320] Nucleotide sequences of the VGAM1517 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1517 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1517 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1517 are further described hereinbelow with reference to Table 1.

[52321] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1517 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1517 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52322] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1517 gene, herein designated VGAM is inhibition of expression of VGAM1517 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1517 correlate with, and may be deduced from, the identity of the target genes which VGAM1517 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52323] Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM\_170845) is a VGAM1517 host target gene. KRT16 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KRT16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRT16 BINDING SITE, designated SEQ ID:45627, to the nucleotide sequence of

VGAM1517 RNA, herein designated VGAM RNA, also designated SEQ ID:4228.

[52324] A function of VGAM1517 is therefore inhibition of Keratin 16 (focal non-epidermolytic palmoplantar keratoderma) (KRT16, Accession XM\_170845). Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT16. MGC3248 (Accession NM\_032486) is another VGAM1517 host target gene. MGC3248 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3248 BINDING SITE, designated SEQ ID:26234, to the nucleotide sequence of VGAM1517 RNA, herein designated VGAM RNA, also designated SEQ ID:4228.

[52325] Another function of VGAM1517 is therefore inhibition of MGC3248 (Accession NM\_032486). Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3248. LOC146515 (Accession XM\_085493) is another VGAM1517 host target gene. LOC146515 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146515 BINDING SITE, designated SEQ ID:38192, to the nucleotide sequence of VGAM1517 RNA, herein designated VGAM RNA, also designated SEQ ID:4228.

[52326] Another function of VGAM1517 is therefore inhibition of LOC146515 (Accession XM\_085493). Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. LOC158301 (Accession XM\_088543) is another VGAM1517 host target gene. LOC158301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158301 BINDING SITE, designated SEQ ID:39809, to the nucleotide sequence of VGAM1517 RNA, herein designated VGAM RNA, also designated SEQ ID:4228.

[52327] Another function of VGAM1517 is therefore inhibition of

LOC158301 (Accession XM\_088543). Accordingly, utilities of VGAM1517 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1518 (VGAM1518) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52328] VGAM1518 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1518 was detected is described hereinabove with reference to Figs. 1-8.

[52329] VGAM1518 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea Seed-borne Mosaic Virus. VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52330] VGAM1518 gene encodes a VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1518 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1518 precursor RNA is designated SEQ ID:1504, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1504 is located at position 9398 relative to the genome of Pea Seed-borne Mosaic Virus.

- [52331] VGAM1518 precursor RNA folds onto itself, forming VGAM1518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52332] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1518 folded precursor RNA into VGAM1518 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide se-

quence of VGAM1518 RNA is designated SEQ ID:4229, and is provided hereinbelow with reference to the sequence listing part.

[52333] VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1518 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52334] VGAM1518 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1518 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1518 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52335] The complementary binding of VGAM1518 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1518 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1518 host target RNA into VGAM1518 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52336] It is appreciated that VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1518 host target genes. The mRNA of each one of this plurality of VGAM1518 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1518 RNA, herein designated VGAM RNA, and which when bound by VGAM1518 RNA causes inhibition of translation of respective one or more VGAM1518 host target proteins.

[52337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1518 gene, herein designated VGAM GENE, on one or more VGAM1518 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52338] It is yet further appreciated that a function of VGAM1518

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1518 include diagnosis, prevention and treatment of viral infection by Pea Seed-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1518 correlate with, and may be deduced from, the identity of the host target genes which VGAM1518 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52339] Nucleotide sequences of the VGAM1518 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1518 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1518 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1518 are further described hereinbelow with reference to Table 1.

[52340] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1518 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1518 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52341] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1518 gene, herein designated VGAM is inhibition of expression of VGAM1518 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1518 correlate with, and may be deduced from, the identity of the target genes which VGAM1518 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52342] DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892) is a VGAM1518 host target gene. DNMT3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNMT3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNMT3B BINDING SITE, designated SEQ ID:13761, to the nucleotide sequence of VGAM1518 RNA, herein designated VGAM RNA, also designated SEQ ID:4229.

[52343] A function of VGAM1518 is therefore inhibition of DNA (cytosine-5-)-methyltransferase 3 Beta (DNMT3B, Accession NM\_006892), a gene which is required for genome wide de novo methylation. Accordingly, utilities of

VGAM1518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNMT3B. The function of DNMT3B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM280. Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879) is another VGAM1518 host target gene. SIAT8C BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SIAT8C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT8C BINDING SITE, designated SEQ ID:18025, to the nucleotide sequence of VGAM1518 RNA, herein designated VGAM RNA, also designated SEQ ID:4229.

[52344] Another function of VGAM1518 is therefore inhibition of Sialyltransferase 8C (alpha2,3Galbeta1,4GlcNAcalpha 2,8-sialyltransferase) (SIAT8C, Accession NM\_015879). Accordingly, utilities of VGAM1518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT8C. LOC149301 (Accession

XM\_086480) is another VGAM1518 host target gene.

LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38691, to the nucleotide sequence of VGAM1518 RNA, herein designated VGAM RNA, also designated SEQ ID:4229.

[52345] Another function of VGAM1518 is therefore inhibition of LOC149301 (Accession XM\_086480). Accordingly, utilities of VGAM1518 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1519 (VGAM1519) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52346] VGAM1519 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1519 was detected is described hereinabove with reference to Figs. 1–8.

[52347] VGAM1519 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pea Seed-borne Mosaic Virus. VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52348] VGAM1519 gene encodes a VGAM1519 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1519 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1519 precursor RNA is designated SEQ ID:1505, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1505 is located at position 3823 relative to the genome of Pea Seed-borne Mosaic Virus.

[52349] VGAM1519 precursor RNA folds onto itself, forming VGAM1519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52350] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1519 folded precursor RNA into VGAM1519 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1519 RNA is designated SEQ ID:4230, and is provided hereinbelow with reference to the sequence listing part.

[52351] VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1519 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52352] VGAM1519 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1519 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1519 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52353] The complementary binding of VGAM1519 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1519 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1519 host target RNA into VGAM1519 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52354] It is appreciated that VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1519 host target genes. The mRNA of each one of this plurality of VGAM1519 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1519 RNA, herein designated VGAM RNA, and which when bound by VGAM1519 RNA causes inhibition of translation of respective one or more VGAM1519 host target proteins.

[52355] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1519 gene, herein designated VGAM GENE, on one or more VGAM1519 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52356] It is yet further appreciated that a function of VGAM1519 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of viral infection by Pea Seed-borne Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1519 correlate with, and may be deduced from, the identity of the host target genes which VGAM1519 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52357] Nucleotide sequences of the VGAM1519 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1519 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1519 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1519 are further described hereinbelow with reference to Table 1.

[52358] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1519 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1519 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52359] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1519 gene, herein designated VGAM is inhibition of expression of VGAM1519 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1519 correlate with, and may be deduced from, the identity of the target genes which VGAM1519 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52360] Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380) is a VGAM1519 host target gene. APPBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by APPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPBP2 BINDING SITE, designated SEQ ID:13082, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52361] A function of VGAM1519 is therefore inhibition of Amyloid Beta Precursor Protein (cytoplasmic tail) Binding Protein 2 (APPBP2, Accession NM\_006380), a gene which interacts with the basolateral sorting signal of amyloid precursor protein. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPBP2. The function of APPBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM525. Dedicator of Cyto-kinesis 1 (DOCK1, Accession NM\_001380) is another VGAM1519 host target gene. DOCK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of DOCK1 BINDING SITE, designated SEQ ID:7051, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52362] Another function of VGAM1519 is therefore inhibition of Dedicator of Cyto-kinesis 1 (DOCK1, Accession NM\_001380), a gene which may function in the extension of cell surfaces. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK1. The function of DOCK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM564. Fucosyltransferase 5 (alpha (1,3) Fucosyltransferase) (FUT5, Accession NM\_002034) is another VGAM1519 host target gene. FUT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT5 BINDING SITE, designated SEQ ID:7788, to the nucleotide sequence of

VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52363] Another function of VGAM1519 is therefore inhibition of Fucosyltransferase 5 (alpha (1,3) Fucosyltransferase) (FUT5, Accession NM\_002034), a gene which may catalyse alpha-1,3 glycosidic linkages involved in the expression of vim-2, lewis x/ssea-1 and sialyl lewis x antigens. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT5. The function of FUT5 has been established by previous studies. Weston et al. (1992) isolated a human alpha-3-fucosyltransferase gene homologous to but distinct from 2 previously reported fucosyltransferase genes: alpha-3,4-fucosyltransferase, thought to represent the human Lewis blood group locus (FUT3; 111100), and an alpha-3-fucosyltransferase expressed in the myeloid lineage (FUT4; 104230). The new enzyme shared 91% amino acid sequence identity with the Lewis blood group fucosyltransferase, yet exhibited only trace amounts of alpha-4-fucosyltransferase activity. By PCR analysis of somatic cell hybrid DNAs, Weston et al. (1992) demonstrated that the gene is located on chromosome 19. They concluded that the gene encodes a 'plasma type'

of alpha-3-fucosyltransferase. McCurley et al. (1995) mapped FUT5 to 19p13.3 by fluorescence in situ hybridization using cosmids containing FUT6 (OMIM Ref. No. 136836) and FUT5. The results indicated that FUT6 lies approximately 70 kb telomeric of FUT5. McCurley et al. (1995) used conventional and pulsed field gel electrophoresis mapping to total genomic DNA and large genomic clones in order to generate a fine map of the cluster of 19p FUT genes. A P1 clone indicated the gene order: cen--FUT5--FUT3--FUT6--tel. FUT5 and FUT3 are separated by 23 kb and FUT3 and FUT6 are separated by 14 kb; these data placed FUT5 and FUT6 closer together than was estimated by fluorescence in situ hybridization. The close proximity and tandem orientation of the 3 genes suggests coordinate regulation. The direction of transcription is toward the telomere in the case of all 3 genes

[52364] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52365] McCurley, R. S.; Recinos, A., III; Olsen, A. S.; Gingrich, J. C.; Szczepaniak, D.; Cameron, H. S.; Krauss, R.; Weston, B. W. : Physical maps of human alpha(1,3)fucosyltransferase genes FUT3-FUT6 on chromosomes 19p13.3 and 11q21.

Genomics 26: 142–146, 1995. ; and

[52366] Weston, B. W.; Nair, R. P.; Larsen, R. D.; Lowe, J. B. : Isolation of a novel human alpha(1,3)fucosyltransferase gene and molecular comparison to the human Lewis blood group alpha(1,3/1.

[52367] Further studies establishing the function and utilities of FUT5 are found in John Hopkins OMIM database record ID 136835, and in cited publications numbered 2177–2179 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Beta 16 (PCDHB16, Accession NM\_020957) is another VGAM1519 host target gene. PCDHB16 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21947, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52368] Another function of VGAM1519 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM\_020957), a gene which is a potential calcium-dependent cell–

adhesion protein. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931. Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM\_016059) is another VGAM1519 host target gene. PPIL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPIL1 BINDING SITE, designated SEQ ID:18134, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52369] Another function of VGAM1519 is therefore inhibition of Peptidylprolyl Isomerase (cyclophilin)-like 1 (PPIL1, Accession NM\_016059), a gene which catalyzes the cis-trans isomerization of proline imidic peptide bonds in oligopeptides. Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with PPIL1. The function of PPIL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1135. Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM\_020630) is another VGAM1519 host target gene. RET BINDING SITE1 and RET BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RET, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE1 and RET BINDING SITE2, designated SEQ ID:21788 and SEQ ID:21962 respectively, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52370] Another function of VGAM1519 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM\_020630), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM1519 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with RET. The function of RET and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.DKFZp762A227 (Accession NM\_014096) is another VGAM1519 host target gene. DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DKFZp762A227, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762A227 BINDING SITE1 and DKFZp762A227 BINDING SITE2, designated SEQ ID:15320 and SEQ ID:19108 respectively, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52371] Another function of VGAM1519 is therefore inhibition of DKFZp762A227 (Accession NM\_014096). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762A227. FLJ14146 (Accession NM\_024709) is another VGAM1519 host target gene. FLJ14146 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24031, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52372] Another function of VGAM1519 is therefore inhibition of FLJ14146 (Accession NM\_024709). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. FLJ20449 (Accession NM\_017826) is another VGAM1519 host target gene. FLJ20449 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20449 BINDING SITE, designated SEQ ID:19488, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52373] Another function of VGAM1519 is therefore inhibition of

FLJ20449 (Accession NM\_017826). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20449. FLJ23548 (Accession NM\_024590) is another VGAM1519 host target gene. FLJ23548 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23548, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23548 BINDING SITE, designated SEQ ID:23824, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52374] Another function of VGAM1519 is therefore inhibition of FLJ23548 (Accession NM\_024590). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23548. KIAA0016 (Accession NM\_014765) is another VGAM1519 host target gene. KIAA0016 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0016, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0016 BINDING SITE, designated SEQ ID:16531, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52375] Another function of VGAM1519 is therefore inhibition of KIAA0016 (Accession NM\_014765). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0016. KIAA1600 (Accession XM\_049351) is another VGAM1519 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35394, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52376] Another function of VGAM1519 is therefore inhibition of KIAA1600 (Accession XM\_049351). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. MGC11287 (Accession NM\_031464) is another

VGAM1519 host target gene. MGC11287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11287 BINDING SITE, designated SEQ ID:25501, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52377] Another function of VGAM1519 is therefore inhibition of MGC11287 (Accession NM\_031464). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11287. MGC17330 (Accession NM\_052880) is another VGAM1519 host target gene. MGC17330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC17330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:27461, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52378] Another function of VGAM1519 is therefore inhibition of MGC17330 (Accession NM\_052880). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC17330. LOC116068 (Accession XM\_057302) is another VGAM1519 host target gene. LOC116068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116068 BINDING SITE, designated SEQ ID:36502, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52379] Another function of VGAM1519 is therefore inhibition of LOC116068 (Accession XM\_057302). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116068. LOC202754 (Accession XM\_095123) is another VGAM1519 host target gene. LOC202754 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202754, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202754 BINDING SITE, designated SEQ ID:40248, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52380] Another function of VGAM1519 is therefore inhibition of LOC202754 (Accession XM\_095123). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202754. LOC90826 (Accession XM\_034321) is another VGAM1519 host target gene. LOC90826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90826 BINDING SITE, designated SEQ ID:32052, to the nucleotide sequence of VGAM1519 RNA, herein designated VGAM RNA, also designated SEQ ID:4230.

[52381] Another function of VGAM1519 is therefore inhibition of LOC90826 (Accession XM\_034321). Accordingly, utilities of VGAM1519 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90826. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1520 (VGAM1520) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52382] VGAM1520 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1520 was detected is described hereinabove with reference to Figs. 1–8.

[52383] VGAM1520 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52384] VGAM1520 gene encodes a VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1520 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1520 precursor RNA is designated SEQ ID:1506, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1506 is located at position 74844 relative to the genome of Ectromelia Virus.

- [52385] VGAM1520 precursor RNA folds onto itself, forming VGAM1520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52386] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1520 folded precursor RNA into VGAM1520 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1520 RNA is designated SEQ ID:4231, and is provided hereinbelow with reference to the sequence listing part.

[52387] VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1520 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52388] VGAM1520 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1520 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1520 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52389] The complementary binding of VGAM1520 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1520 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1520 host target RNA into VGAM1520 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52390] It is appreciated that VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1520 host target genes. The mRNA of each one of this plurality of VGAM1520 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1520 RNA, herein designated VGAM RNA, and which when bound by VGAM1520 RNA causes

inhibition of translation of respective one or more VGAM1520 host target proteins.

[52391] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1520 gene, herein designated VGAM GENE, on one or more VGAM1520 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52392] It is yet further appreciated that a function of VGAM1520 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1520 include diagnosis, prevention and

treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1520 correlate with, and may be deduced from, the identity of the host target genes which VGAM1520 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52393] Nucleotide sequences of the VGAM1520 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1520 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1520 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1520 are further described hereinbelow with reference to Table 1.

[52394] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1520 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1520 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52395] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1520 gene, herein designated VGAM is inhibition of expression of VGAM1520 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1520 correlate with, and may be deduced from, the identity of the target genes which VGAM1520 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52396] High-mobility Group Box 3 (HMGB3, Accession NM\_005342) is a VGAM1520 host target gene. HMGB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGB3 BINDING SITE, designated SEQ ID:11816, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52397] A function of VGAM1520 is therefore inhibition of High-mobility Group Box 3 (HMGB3, Accession NM\_005342), a gene which plays a fundamental role in DNA replication, nucleosome assembly, and transcription. Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGB3. The function of HMGB3 and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM1272.SMAC (Accession NM\_138930) is another VGAM1520 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29054, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52398] Another function of VGAM1520 is therefore inhibition of SMAC (Accession NM\_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.DKFZp547D155 (Accession XM\_046977) is another VGAM1520 host target gene. DKFZp547D155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DK-

FZp547D155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547D155 BINDING SITE, designated SEQ ID:34865, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52399] Another function of VGAM1520 is therefore inhibition of DKFZp547D155 (Accession XM\_046977). Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547D155. FLJ11126 (Accession NM\_018332) is another VGAM1520 host target gene. FLJ11126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11126 BINDING SITE, designated SEQ ID:20333, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52400] Another function of VGAM1520 is therefore inhibition of FLJ11126 (Accession NM\_018332). Accordingly, utilities of

VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11126. FLJ12704 (Accession NM\_024998) is another VGAM1520 host target gene. FLJ12704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:24560, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52401] Another function of VGAM1520 is therefore inhibition of FLJ12704 (Accession NM\_024998). Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. FLJ20309 (Accession NM\_017759) is another VGAM1520 host target gene. FLJ20309 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20309, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20309

BINDING SITE, designated SEQ ID:19370, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52402] Another function of VGAM1520 is therefore inhibition of FLJ20309 (Accession NM\_017759). Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20309. LOC148696 (Accession XM\_097505) is another VGAM1520 host target gene. LOC148696 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148696 BINDING SITE, designated SEQ ID:40892, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52403] Another function of VGAM1520 is therefore inhibition of LOC148696 (Accession XM\_097505). Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148696. LOC149276 (Accession XM\_097621) is another VGAM1520 host target gene. LOC149276 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40973, to the nucleotide sequence of VGAM1520 RNA, herein designated VGAM RNA, also designated SEQ ID:4231.

[52404] Another function of VGAM1520 is therefore inhibition of LOC149276 (Accession XM\_097621). Accordingly, utilities of VGAM1520 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1521 (VGAM1521) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52405] VGAM1521 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1521 was detected is described hereinabove with reference to Figs. 1-8.

[52406] VGAM1521 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52407] VGAM1521 gene encodes a VGAM1521 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1521 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1521 precursor RNA is designated SEQ ID:1507, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1507 is located at position 67798 relative to the genome of Ectromelia Virus.

[52408] VGAM1521 precursor RNA folds onto itself, forming VGAM1521 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[52409] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1521 folded precursor RNA into VGAM1521 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1521 RNA is designated SEQ ID:4232, and is provided hereinbelow with reference to the sequence listing part.

[52410] VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1521 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52411] VGAM1521 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1521 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1521 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1521 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52412] The complementary binding of VGAM1521 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1521 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1521 host target RNA into VGAM1521 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52413] It is appreciated that VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1521 host target genes. The mRNA of each one of this plurality of VGAM1521 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1521 RNA, herein designated VGAM RNA, and which when bound by VGAM1521 RNA causes inhibition of translation of respective one or more VGAM1521 host target proteins.

[52414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1521 gene, herein designated VGAM GENE, on one or more VGAM1521 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52415] It is yet further appreciated that a function of VGAM1521 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1521 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1521 correlate with, and may be deduced from, the identity of the host target genes which VGAM1521 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52416] Nucleotide sequences of the VGAM1521 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1521 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1521 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1521 are further described hereinbelow with reference to Table 1.

[52417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1521 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1521 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52418] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1521 gene, herein designated VGAM is inhibition of expression of VGAM1521 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1521 correlate with, and may be deduced from, the identity of the target genes which VGAM1521 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52419] TRIM (Accession NM\_016388) is a VGAM1521 host target gene. TRIM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of TRIM BINDING SITE, designated SEQ ID:18528, to the nucleotide sequence of VGAM1521 RNA, herein designated VGAM RNA, also designated SEQ ID:4232.

[52420] A function of VGAM1521 is therefore inhibition of TRIM (Accession NM\_016388), a gene which plays a role in recruiting signaling proteins to the plasma membrane upon T-cell receptor (TCR) complex activation in T cells. Accordingly, utilities of VGAM1521 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM. The function of TRIM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM227.PRO2037 (Accession NM\_018616) is another VGAM1521 host target gene. PRO2037 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2037 BINDING SITE, designated SEQ ID:20687, to the nucleotide sequence of VGAM1521 RNA, herein designated VGAM RNA, also designated SEQ ID:4232.

[52421] Another function of VGAM1521 is therefore inhibition of PRO2037 (Accession NM\_018616). Accordingly, utilities of VGAM1521 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2037. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1522 (VGAM1522) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52422] VGAM1522 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1522 was detected is described hereinabove with reference to Figs. 1-8.

[52423] VGAM1522 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52424] VGAM1522 gene encodes a VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1522 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1522 precursor RNA is designated SEQ ID:1508, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1508 is located at position 72179 relative to the genome of Ectromelia Virus.

- [52425] VGAM1522 precursor RNA folds onto itself, forming VGAM1522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52426] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1522 folded precursor RNA into VGAM1522 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1522 RNA is designated SEQ ID:4233, and is provided hereinbelow with reference to the sequence listing part.

[52427] VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1522 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52428] VGAM1522 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1522 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1522 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52429] The complementary binding of VGAM1522 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1522 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1522 host target RNA into VGAM1522 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52430] It is appreciated that VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1522 host target genes. The mRNA of each one of this plurality of VGAM1522 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1522 RNA, herein designated VGAM RNA, and which when bound by VGAM1522 RNA causes inhibition of translation of respective one or more VGAM1522 host target proteins.

[52431] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1522 gene, herein designated VGAM GENE, on one or more VGAM1522 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52432] It is yet further appreciated that a function of VGAM1522 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1522 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1522 correlate with, and may be deduced from, the identity of the host target genes which VGAM1522 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52433] Nucleotide sequences of the VGAM1522 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1522 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1522 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1522 are further described hereinbelow with reference to Table 1.

[52434] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1522 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1522 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[52435] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1522 gene, herein designated VGAM is inhibition of expression of VGAM1522 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1522 correlate with, and may be deduced from, the identity of the target genes which VGAM1522 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52436] KIAA1691 (Accession XM\_166523) is a VGAM1522 host target gene. KIAA1691 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1691, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1691 BINDING SITE, designated SEQ ID:44464, to the nucleotide sequence of VGAM1522 RNA, herein designated VGAM RNA, also designated SEQ ID:4233.

[52437] A function of VGAM1522 is therefore inhibition of KIAA1691 (Accession XM\_166523). Accordingly, utilities of VGAM1522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1691. LOC154813 (Accession XM\_088051) is another VGAM1522 host target gene. LOC154813 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154813 BINDING SITE, designated SEQ ID:39492, to the nucleotide sequence of VGAM1522 RNA, herein designated VGAM RNA, also designated SEQ ID:4233.

[52438] Another function of VGAM1522 is therefore inhibition of LOC154813 (Accession XM\_088051). Accordingly, utilities of VGAM1522 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154813. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1523 (VGAM1523) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52439] VGAM1523 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1523 was detected is described hereinabove with reference to Figs. 1–8.

[52440] VGAM1523 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52441] VGAM1523 gene encodes a VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1523 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1523 precursor RNA is designated SEQ ID:1509, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1509 is located at position 79940 relative to the genome of Cowpox Virus.

[52442] VGAM1523 precursor RNA folds onto itself, forming VGAM1523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52443] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1523 folded precursor RNA into VGAM1523 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1523 RNA is designated SEQ ID:4234, and is provided hereinbelow with reference to the sequence listing part.

[52444] VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1523 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52445] VGAM1523 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1523 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1523 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52446] The complementary binding of VGAM1523 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1523 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1523 host target RNA into VGAM1523 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52447] It is appreciated that VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1523 host target genes. The mRNA of each one of this plurality of VGAM1523 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1523 RNA, herein designated VGAM RNA, and which when bound by VGAM1523 RNA causes inhibition of translation of respective one or more VGAM1523 host target proteins.

[52448] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1523 gene, herein designated VGAM GENE, on one or more VGAM1523 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52449] It is yet further appreciated that a function of VGAM1523 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1523 correlate with, and may be deduced from, the identity of the host target genes which VGAM1523 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52450] Nucleotide sequences of the VGAM1523 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1523 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1523 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1523 are further described hereinbelow with reference to Table 1.

[52451] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1523 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1523 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52452] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1523 gene, herein designated VGAM is inhibition of expression of VGAM1523 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1523 correlate with, and may be deduced from, the identity of the target genes which VGAM1523 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52453] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089) is a VGAM1523 host target gene. ABCB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by ABCB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB10 BINDING SITE, designated SEQ ID:14374, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52454] A function of VGAM1523 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089), a gene which a member of the superfamily of ATP-binding cassette (ABC) transporters. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB10. The function of ABCB10 has been established by previous studies. For background information on the ATP-binding cassette (ABC) family of transporter proteins, see ABCA4 (OMIM Ref. No. 601691). In addition to the 'full' ABC transporters with 2 transmembrane domains and 2 nucleotide-binding domains, there are 'half' proteins that contain only 1 of each domain (e.g., ABCB1; 171050). Allikmets et al. (1995) mapped a partial EST corresponding to the ABCB10 gene to 1q42. However, using FISH, Zhang et al. (2000)

mapped the full-length ABCB10 gene to 15q13–q14. PCR and Southern blot analysis of genomic DNA showed that the chromosome 15 localization represents a pseudogene.

[52455] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52456] Allikmets, R.; Gerrard, B.; Glavac, D.; Ravnik–Glavac, M.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Modi, W.; Dean, M. : Characterization and mapping of three new mammalian ATP–binding transporter genes from an EST database. *Mammalian Genome* 6: 114–117, 1995. ; and

[52457] Zhang, F.; Hogue, D. L.; Liu, L.; Fisher, C. L.; Hui, D.; Childs, S.; Ling, V. : M–ABC2, a new human mitochondrial ATP–binding cassette membrane protein. *FEBS Lett.* 478: 89–94, 2000.

[52458] Further studies establishing the function and utilities of ABCB10 are found in John Hopkins OMIM database record ID 605454, and in cited publications numbered 963–964 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adducin 1 (alpha) (ADD1, Accession NM\_014189) is another VGAM1523 host target gene. ADD1 BINDING SITE1 and ADD1 BINDING SITE2 are HOST TARGET binding sites found in untrans–

lated regions of mRNA encoded by ADD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE1 and ADD1 BINDING SITE2, designated SEQ ID:15470 and SEQ ID:15474 respectively, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52459] Another function of VGAM1523 is therefore inhibition of Adducin 1 (alpha) (ADD1, Accession NM\_014189), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD1. The function of ADD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM\_006641) is another VGAM1523 host target gene. CCR9 BINDING SITE1 and CCR9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR9, corresponding to HOST TARGET binding sites such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR9 BINDING SITE1 and CCR9 BINDING SITE2, designated SEQ ID:13432 and SEQ ID:22412 respectively, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52460] Another function of VGAM1523 is therefore inhibition of Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM\_006641), a gene which binds beta-chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9. The function of CCR9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1324.CGTHBA (Accession NM\_012075) is another VGAM1523 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA

BINDING SITE, designated SEQ ID:14364, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52461] Another function of VGAM1523 is therefore inhibition of CGTHBA (Accession NM\_012075). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is another VGAM1523 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42721, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52462] Another function of VGAM1523 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440) is another VGAM1523 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7171, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52463] Another function of VGAM1523 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM95. Growth Hormone Receptor (GHR, Accession NM\_000163) is another VGAM1523 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5671, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52464] Another function of VGAM1523 is therefore inhibition of Growth Hormone Receptor (GHR, Accession NM\_000163). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM1523 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

HS2ST1 BINDING SITE, designated SEQ ID:14576, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52465] Another function of VGAM1523 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Nucleobindin 1 (NUCB1, Accession NM\_006184) is another VGAM1523 host target gene. NUCB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCB1 BINDING SITE, designated SEQ ID:12851, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52466] Another function of VGAM1523 is therefore inhibition of Nucleobindin 1 (NUCB1, Accession NM\_006184), a gene which may have a role in calcium homeostasis. Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with NUCB1. The function of NUCB1 has been established by previous studies. Lupus-prone mice with the lymphoproliferation (lpr) mutation produced large amounts of antibody against both single-stranded and double-stranded DNA (Theofilopoulos and Dixon, 1985). The primary defect is a deficiency in expression of the Fas gene (OMIM Ref. No. 134637). Nucleobindin (Nuc) was first identified as a secreted protein of 55 kD that promotes production of DNA-specific antibodies in these mice (Kanai et al., 1993). Analysis of cDNA that encodes mouse Nuc demonstrated that the protein is composed of a signal peptide, a DNA-binding site, 2 calcium-binding motifs, and a leucine zipper (Miura et al., 1992). Miura et al. (1996) analyzed the organization of the human NUC gene. It consists of 13 exons that are distributed in a region of 32 kb. The gene encodes a 461-amino acid polypeptide. The functional motifs identified in the murine protein are encoded in corresponding human exons. A 2.4-kb NUC transcript was expressed in all organs examined. Comparison of nucleotide sequences in the promoter regions between human and mouse NUC genes revealed several conserved sequences. The promoter is of the TATA-less type, and transcription starts at multiple

sites in both the human and the mouse genes. These features suggested to them that NUC may play a role as a housekeeping gene. By PCR analysis of human/hamster somatic cell hybrids and by fluorescence in situ hybridization, Miura et al. (1996) mapped the NUC gene to 19q13.2–q13.4.

[52467] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52468] Kanai, Y.; Miura, K.; Uehara, T.; Amagai, M.; Takeda, O.; Tanuma, S.; Kurosawa, Y. : Natural occurrence of Nuc in the sera of autoimmune–prone MRL/lpr mice. *Biochem. Biophys. Res. Commun.* 196: 729–736, 1993. ; and

[52469] Miura, K.; Hirai, M.; Kanai, Y.; Kurosawa, Y. : Organization of the human gene for nucleobindin (NUC) and its chromosomal assignment to 19q13.2–q13.4. *Genomics* 34: 181–186, 1996.

[52470] Further studies establishing the function and utilities of NUCB1 are found in John Hopkins OMIM database record ID 601323, and in cited publications numbered 9385–938 and 10961 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CDC42 Binding Protein Kinase Beta (DMPK–like) (CDC42BPB, Ac–

cession NM\_006035) is another VGAM1523 host target gene. CDC42BPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC42BPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42BPB BINDING SITE, designated SEQ ID:12658, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52471] Another function of VGAM1523 is therefore inhibition of CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM\_006035). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42BPB. DKFZP566B183 (Accession NM\_015509) is another VGAM1523 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ

ID:17769, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52472] Another function of VGAM1523 is therefore inhibition of DKFZP566B183 (Accession NM\_015509). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. DKFZP566I1024 (Accession XM\_046506) is another VGAM1523 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:34735, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52473] Another function of VGAM1523 is therefore inhibition of DKFZP566I1024 (Accession XM\_046506). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. DKFZp761B0514 (Accession

NM\_032289) is another VGAM1523 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26053, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52474] Another function of VGAM1523 is therefore inhibition of DKFZp761B0514 (Accession NM\_032289). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. FLJ13305 (Accession XM\_117270) is another VGAM1523 host target gene. FLJ13305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13305 BINDING SITE, designated SEQ ID:43345, to the nucleotide sequence of VGAM1523 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4234.

[52475] Another function of VGAM1523 is therefore inhibition of FLJ13305 (Accession XM\_117270). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13305. KIAA0265 (Accession XM\_045954) is another VGAM1523 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34620, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52476] Another function of VGAM1523 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA1117 (Accession XM\_028219) is another VGAM1523 host target gene. KIAA1117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1117, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1117 BINDING SITE, designated SEQ ID:30632, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52477] Another function of VGAM1523 is therefore inhibition of KIAA1117 (Accession XM\_028219). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1117. KIAA1319 (Accession NM\_020770) is another VGAM1523 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21870, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52478] Another function of VGAM1523 is therefore inhibition of KIAA1319 (Accession NM\_020770). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1319. Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512) is another VGAM1523 host target gene. NUDT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT13 BINDING SITE, designated SEQ ID:31664, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52479] Another function of VGAM1523 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT13. SSH2 (Accession XM\_030846) is another VGAM1523 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31176, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52480] Another function of VGAM1523 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144) is another VGAM1523 host target gene. SSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9113, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52481] Another function of VGAM1523 is therefore inhibition of Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144). Accordingly, utilities of VGAM1523 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SSR1. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM1523 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18072, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52482] Another function of VGAM1523 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. LOC115294 (Accession XM\_054302) is another VGAM1523 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36145, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52483] Another function of VGAM1523 is therefore inhibition of LOC115294 (Accession XM\_054302). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC150271 (Accession XM\_097859) is another VGAM1523 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41166, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52484] Another function of VGAM1523 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC150271. LOC151877 (Accession XM\_098132) is another VGAM1523 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41398, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52485] Another function of VGAM1523 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC152300 (Accession XM\_087432) is another VGAM1523 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39248, to

the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52486] Another function of VGAM1523 is therefore inhibition of LOC152300 (Accession XM\_087432). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC154084 (Accession XM\_098468) is another VGAM1523 host target gene. LOC154084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154084 BINDING SITE, designated SEQ ID:41685, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52487] Another function of VGAM1523 is therefore inhibition of LOC154084 (Accession XM\_098468). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154084. LOC158402 (Accession XM\_098936) is another VGAM1523 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41976, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52488] Another function of VGAM1523 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC162333 (Accession XM\_102591) is another VGAM1523 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42124, to the nucleotide sequence of VGAM1523 RNA, herein designated VGAM RNA, also designated SEQ ID:4234.

[52489] Another function of VGAM1523 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities

of VGAM1523 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1524 (VGAM1524) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52490] VGAM1524 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1524 was detected is described hereinabove with reference to Figs. 1-8.

[52491] VGAM1524 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52492] VGAM1524 gene encodes a VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1524 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1524 precursor RNA is designated SEQ ID:1510, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1510 is located at position 76982 relative to the genome of Cowpox Virus.

- [52493] VGAM1524 precursor RNA folds onto itself, forming VGAM1524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52494] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1524 folded precursor RNA into VGAM1524 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1524 RNA is designated SEQ ID:4235, and

is provided hereinbelow with reference to the sequence listing part.

[52495] VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1524 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[52496] VGAM1524 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1524 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1524 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52497] The complementary binding of VGAM1524 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1524 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1524 host target RNA into VGAM1524 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52498] It is appreciated that VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1524 host target genes. The mRNA of each one of this plurality of VGAM1524 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM1524 RNA, herein designated VGAM RNA, and which when bound by VGAM1524 RNA causes inhibition of translation of respective one or more VGAM1524 host target proteins.

[52499] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1524 gene, herein designated VGAM GENE, on one or more VGAM1524 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52500] It is yet further appreciated that a function of VGAM1524 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1524 correlate with, and may be deduced from, the identity of the host target genes which VGAM1524 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52501] Nucleotide sequences of the VGAM1524 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1524 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1524 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1524 are further described hereinbelow with reference to Table 1.

[52502] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1524 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1524 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52503] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1524 gene, herein designated VGAM is inhibition of expression of VGAM1524 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1524 correlate with, and may be deduced from, the identity of the target genes which VGAM1524 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52504] Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM\_138691) is a VGAM1524 host target gene. TMC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TMC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMC1 BINDING SITE, designated SEQ ID:28931, to the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, also designated SEQ ID:4235.

[52505] A function of VGAM1524 is therefore inhibition of Transmembrane, Cochlear Expressed, 1 (TMC1, Accession NM\_138691), a gene which is required for normal function of cochlear hair cells. Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMC1. The func-

tion of TMC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM554.KIAA0546 (Accession XM\_049055) is another VGAM1524 host target gene. KIAA0546 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0546 BINDING SITE, designated SEQ ID:35332, to the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, also designated SEQ ID:4235.

[52506] Another function of VGAM1524 is therefore inhibition of KIAA0546 (Accession XM\_049055). Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0546. LOC143879 (Accession XM\_084666) is another VGAM1524 host target gene. LOC143879 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143879, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC143879 BINDING SITE, designated SEQ ID:37656, to the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, also designated SEQ ID:4235.

[52507] Another function of VGAM1524 is therefore inhibition of LOC143879 (Accession XM\_084666). Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143879. LOC153222 (Accession XM\_087631) is another VGAM1524 host target gene. LOC153222 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153222 BINDING SITE, designated SEQ ID:39366, to the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, also designated SEQ ID:4235.

[52508] Another function of VGAM1524 is therefore inhibition of LOC153222 (Accession XM\_087631). Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153222. LOC219988 (Accession XM\_166223) is an-

other VGAM1524 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:44041, to the nucleotide sequence of VGAM1524 RNA, herein designated VGAM RNA, also designated SEQ ID:4235.

[52509] Another function of VGAM1524 is therefore inhibition of LOC219988 (Accession XM\_166223). Accordingly, utilities of VGAM1524 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1525 (VGAM1525) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52510] VGAM1525 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1525 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[52511] VGAM1525 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus.

VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52512] VGAM1525 gene encodes a VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1525 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1525 precursor RNA is designated SEQ ID:1511, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1511 is located at position 62387 relative to the genome of Camelpox Virus.

[52513] VGAM1525 precursor RNA folds onto itself, forming VGAM1525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52514] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1525 folded precursor RNA into VGAM1525 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1525 RNA is designated SEQ ID:4236, and is provided hereinbelow with reference to the sequence listing part.

[52515] VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1525 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52516] VGAM1525 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1525 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1525 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1525 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52517] The complementary binding of VGAM1525 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1525 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1525 host target RNA into VGAM1525 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52518] It is appreciated that VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1525 host target genes. The mRNA of each one of this plurality of VGAM1525 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1525 RNA, herein designated VGAM RNA, and which when bound by VGAM1525 RNA causes inhibition of translation of respective one or more VGAM1525 host target proteins.

[52519] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1525 gene, herein designated VGAM GENE, on one or more VGAM1525 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52520] It is yet further appreciated that a function of VGAM1525 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1525 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1525 correlate with, and may be deduced from, the identity of the host target genes which VGAM1525 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52521] Nucleotide sequences of the VGAM1525 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1525 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1525 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1525 are further described hereinbelow with reference to Table 1.

[52522] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1525 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1525 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52523] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1525 gene, herein designated VGAM is inhibition of expression of VGAM1525 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1525 correlate with, and may be deduced from, the identity of the target genes which VGAM1525 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52524] LOC170409 (Accession XM\_096330) is a VGAM1525 host target gene. LOC170409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170409 BINDING SITE, designated SEQ ID:40314, to the nucleotide sequence of VGAM1525 RNA, herein designated VGAM RNA, also designated SEQ ID:4236.

[52525] A function of VGAM1525 is therefore inhibition of LOC170409 (Accession XM\_096330). Accordingly, utilities of VGAM1525 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1526 (VGAM1526) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52526] VGAM1526 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1526 was detected is described hereinabove with reference to Figs. 1-8.

[52527] VGAM1526 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1526 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[52528] VGAM1526 gene encodes a VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1526 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1526 precursor RNA is designated SEQ ID:1512, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1512 is located at position 71872 relative to the genome of Ectromelia Virus.

[52529] VGAM1526 precursor RNA folds onto itself, forming VGAM1526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52530] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1526 folded precursor RNA into VGAM1526

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1526 RNA is designated SEQ ID:4237, and is provided hereinbelow with reference to the sequence listing part.

[52531] VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1526 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52532] VGAM1526 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1526 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1526 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52533] The complementary binding of VGAM1526 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1526 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1526 host target RNA into VGAM1526 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[52534] It is appreciated that VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1526 host target genes. The mRNA of each one of this plurality of VGAM1526 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1526 RNA, herein designated VGAM RNA, and which when bound by VGAM1526 RNA causes inhibition of translation of respective one or more VGAM1526 host target proteins.

[52535] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1526 gene, herein designated VGAM GENE, on one or more VGAM1526 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52536] It is yet further appreciated that a function of VGAM1526 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1526 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1526 correlate with, and may be deduced from, the identity of the host target genes which VGAM1526 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52537] Nucleotide sequences of the VGAM1526 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1526 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1526 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1526 are further described hereinbelow with reference to Table 1.

[52538] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1526 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1526 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52539] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1526 gene, herein designated VGAM is inhibition of expression of VGAM1526 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1526 correlate with, and may be deduced from, the identity of the target genes which VGAM1526 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52540] Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM\_004454) is a VGAM1526 host target gene. ETV5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETV5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ETV5 BINDING SITE, designated SEQ ID:10749, to the nucleotide sequence of VGAM1526 RNA, herein designated

VGAM RNA, also designated SEQ ID:4237.

[52541] A function of VGAM1526 is therefore inhibition of Ets Variant Gene 5 (ets-related molecule) (ETV5, Accession NM\_004454), a gene which DNA binding protein of the Ets oncoprotein family. Accordingly, utilities of VGAM1526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETV5. The function of ETV5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1171.WW Domain Containing Oxidoreductase (WWOX, Accession NM\_016373) is another VGAM1526 host target gene. WWOX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWOX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWOX BINDING SITE, designated SEQ ID:18507, to the nucleotide sequence of VGAM1526 RNA, herein designated VGAM RNA, also designated SEQ ID:4237.

[52542] Another function of VGAM1526 is therefore inhibition of WW Domain Containing Oxidoreductase (WWOX, Acces-

sion NM\_016373), a gene which involves in protein-protein interactions and may contribute to the biologic consequences of DNA instability. Accordingly, utilities of VGAM1526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWOX. The function of WWOX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM644. Cab45 (Accession NM\_016547) is another VGAM1526 host target gene. Cab45 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Cab45, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Cab45 BINDING SITE, designated SEQ ID:18620, to the nucleotide sequence of VGAM1526 RNA, herein designated VGAM RNA, also designated SEQ ID:4237.

[52543] Another function of VGAM1526 is therefore inhibition of Cab45 (Accession NM\_016547). Accordingly, utilities of VGAM1526 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Cab45. Fig. 1 further provides a conceptual description of a novel

bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1527 (VGAM1527) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52544] VGAM1527 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1527 was detected is described hereinabove with reference to Figs. 1–8.

[52545] VGAM1527 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Camelpox Virus. VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52546] VGAM1527 gene encodes a VGAM1527 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1527 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1527 precursor RNA is designated SEQ ID:1513, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1513 is located at position 68087 relative to the

genome of Camelpox Virus.

[52547] VGAM1527 precursor RNA folds onto itself, forming VGAM1527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52548] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1527 folded precursor RNA into VGAM1527 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM1527 RNA is designated SEQ ID:4238, and is provided hereinbelow with reference to the sequence listing part.

[52549] VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1527 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52550] VGAM1527 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1527 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1527 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52551] The complementary binding of VGAM1527 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1527 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1527 host target RNA into VGAM1527 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52552] It is appreciated that VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1527 host target genes. The mRNA of each one of this plurality of VGAM1527 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1527 RNA, herein designated VGAM RNA, and which when bound by VGAM1527 RNA causes inhibition of translation of respective one or more VGAM1527 host target proteins.

[52553] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1527 gene, herein designated VGAM GENE, on one or more VGAM1527 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52554] It is yet further appreciated that a function of VGAM1527 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1527 include diagnosis, prevention and treatment of viral infection by Camelpox Virus. Specific functions, and accordingly utilities, of VGAM1527 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1527 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52555] Nucleotide sequences of the VGAM1527 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1527 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1527 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1527 are further described hereinbelow with reference to Table 1.

[52556] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1527 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1527 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52557] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1527 gene, herein designated VGAM is inhibition of expression of VGAM1527 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1527 correlate with, and may be deduced

from, the identity of the target genes which VGAM1527 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52558] Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM\_020987) is a VGAM1527 host target gene. ANK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK3 BINDING SITE, designated SEQ ID:21980, to the nucleotide sequence of VGAM1527 RNA, herein designated VGAM RNA, also designated SEQ ID:4238.

[52559] A function of VGAM1527 is therefore inhibition of Ankyrin 3, Node of Ranvier (ankyrin G) (ANK3, Accession NM\_020987), a gene which plays key roles in activities such as cell motility, activation, proliferation. Accordingly, utilities of VGAM1527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK3. The function of ANK3 has been established by previous studies. Tse et al. (1991) studied immunoreactive isoforms of erythrocyte ankyrin found in nonerythroid tissues. Using an erythrocyte ankyrin cDNA clone as a hy-

bridization probe, they isolated a clone from a human genomic library that hybridized at low but not at high stringency. Further studies suggested that the clone represented part of a gene for nonerythroid ankyrin, which they designated ANK2. By analysis of somatic cell hybrids and by fluorescence in situ hybridization, they assigned ANK2 to 4q25–q27. Otto et al. (1991) isolated and sequenced cDNAs related to 2 brain ankyrin isoforms and showed that they are produced through alternative splicing of the mRNA from a single gene. By analysis of human/rodent cell hybrids, Otto et al. (1991) assigned the brain ankyrin gene to chromosome 4.

[52560] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52561] Otto, E.; Kunimoto, M.; McLaughlin, T.; Bennett, V. : Isolation and characterization of cDNAs encoding human brain ankyrins reveal a family of alternatively spliced genes. *J. Cell Biol.* 114: 241–253, 1991. ; and

[52562] Tse, W. T.; Menninger, J. C.; Yang–Feng, T. L.; Francke, U.; Sahr, K. E.; Lux, S. E.; Ward, D. C.; Forget, B. G. : Isolation and chromosomal localization of a novel non–erythroid ankyri.

[52563] Further studies establishing the function and utilities of ANK3 are found in John Hopkins OMIM database record ID 600465, and in cited publications numbered 1607, 672 and 7731 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ22029 (Accession NM\_024949) is another VGAM1527 host target gene. FLJ22029 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22029, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22029 BINDING SITE, designated SEQ ID:24503, to the nucleotide sequence of VGAM1527 RNA, herein designated VGAM RNA, also designated SEQ ID:4238.

[52564] Another function of VGAM1527 is therefore inhibition of FLJ22029 (Accession NM\_024949). Accordingly, utilities of VGAM1527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22029. KIAA1579 (Accession NM\_018211) is another VGAM1527 host target gene. KIAA1579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1579, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1579 BINDING SITE, designated SEQ ID:20115, to the nucleotide sequence of VGAM1527 RNA, herein designated VGAM RNA, also designated SEQ ID:4238.

[52565] Another function of VGAM1527 is therefore inhibition of KIAA1579 (Accession NM\_018211). Accordingly, utilities of VGAM1527 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1579. LOC149153 (Accession XM\_097599) is another VGAM1527 host target gene. LOC149153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149153 BINDING SITE, designated SEQ ID:40961, to the nucleotide sequence of VGAM1527 RNA, herein designated VGAM RNA, also designated SEQ ID:4238.

[52566] Another function of VGAM1527 is therefore inhibition of LOC149153 (Accession XM\_097599). Accordingly, utilities of VGAM1527 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC149153. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1528 (VGAM1528) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52567] VGAM1528 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1528 was detected is described hereinabove with reference to Figs. 1–8.

[52568] VGAM1528 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52569] VGAM1528 gene encodes a VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1528 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1528 precursor RNA is desig-

nated SEQ ID:1514, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1514 is located at position 72786 relative to the genome of Ectromelia Virus.

- [52570] VGAM1528 precursor RNA folds onto itself, forming VGAM1528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52571] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1528 folded precursor RNA into VGAM1528 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1528 RNA is designated SEQ ID:4239, and is provided hereinbelow with reference to the sequence

listing part.

[52572] VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1528 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52573] VGAM1528 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1528 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1528 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52574] The complementary binding of VGAM1528 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1528 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1528 host target RNA into VGAM1528 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52575] It is appreciated that VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1528 host target genes. The mRNA of each one of this plurality of VGAM1528 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1528 RNA, herein designated VGAM

RNA, and which when bound by VGAM1528 RNA causes inhibition of translation of respective one or more VGAM1528 host target proteins.

[52576] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1528 gene, herein designated VGAM GENE, on one or more VGAM1528 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52577] It is yet further appreciated that a function of VGAM1528 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1528 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1528 correlate with, and may be deduced from, the identity of the host target genes which VGAM1528 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52578] Nucleotide sequences of the VGAM1528 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1528 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1528 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1528 are further described hereinbelow with reference to Table 1.

[52579] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1528 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1528 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52580] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1528 gene, herein designated VGAM is

inhibition of expression of VGAM1528 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1528 correlate with, and may be deduced from, the identity of the target genes which VGAM1528 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52581] Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898) is a VGAM1528 host target gene. M11S1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by M11S1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M11S1 BINDING SITE, designated SEQ ID:12516, to the nucleotide sequence of VGAM1528 RNA, herein designated VGAM RNA, also designated SEQ ID:4239.

[52582] A function of VGAM1528 is therefore inhibition of Membrane Component, Chromosome 11, Surface Marker 1 (M11S1, Accession NM\_005898), a gene which may play a role in transporting nutrients from the gut lumen across the gutlining epithelial cell layer. Accordingly, utilities of VGAM1528 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with M11S1. The function of M11S1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Placenta-specific 1 (PLAC1, Accession NM\_021796) is another VGAM1528 host target gene. PLAC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PLAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC1 BINDING SITE, designated SEQ ID:22352, to the nucleotide sequence of VGAM1528 RNA, herein designated VGAM RNA, also designated SEQ ID:4239.

[52583] Another function of VGAM1528 is therefore inhibition of Placenta-specific 1 (PLAC1, Accession NM\_021796). Accordingly, utilities of VGAM1528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC1. Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838) is another VGAM1528 host target gene. UBE3A BINDING SITE1

through UBE3A BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UBE3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE3A BINDING SITE1 through UBE3A BINDING SITE3, designated SEQ ID:28360, SEQ ID:28364 and SEQ ID:6079 respectively, to the nucleotide sequence of VGAM1528 RNA, herein designated VGAM RNA, also designated SEQ ID:4239.

[52584] Another function of VGAM1528 is therefore inhibition of Ubiquitin Protein Ligase E3A (human papilloma virus E6-associated protein, Angelman syndrome) (UBE3A, Accession NM\_130838). Accordingly, utilities of VGAM1528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE3A. LOC91250 (Accession XM\_037135) is another VGAM1528 host target gene. LOC91250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91250, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91250 BINDING SITE, desig-

nated SEQ ID:32548, to the nucleotide sequence of VGAM1528 RNA, herein designated VGAM RNA, also designated SEQ ID:4239.

[52585] Another function of VGAM1528 is therefore inhibition of LOC91250 (Accession XM\_037135). Accordingly, utilities of VGAM1528 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1529 (VGAM1529) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52586] VGAM1529 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1529 was detected is described hereinabove with reference to Figs. 1–8.

[52587] VGAM1529 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52588] VGAM1529 gene encodes a VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1529 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1529 precursor RNA is designated SEQ ID:1515, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1515 is located at position 69246 relative to the genome of Ectromelia Virus.

[52589] VGAM1529 precursor RNA folds onto itself, forming VGAM1529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52590] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1529 folded precursor RNA into VGAM1529 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1529 RNA is designated SEQ ID:4240, and is provided hereinbelow with reference to the sequence listing part.

[52591] VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1529 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52592] VGAM1529 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1529 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1529 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52593] The complementary binding of VGAM1529 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1529 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1529 host target RNA into VGAM1529 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52594] It is appreciated that VGAM1529 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1529 host target genes. The mRNA of each one of this plurality of VGAM1529 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1529 RNA, herein designated VGAM RNA, and which when bound by VGAM1529 RNA causes inhibition of translation of respective one or more VGAM1529 host target proteins.

[52595] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1529 gene, herein designated VGAM GENE, on one or more VGAM1529 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[52596] It is yet further appreciated that a function of VGAM1529 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1529 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1529 correlate with, and may be deduced from, the identity of the host target genes which VGAM1529 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52597] Nucleotide sequences of the VGAM1529 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1529 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1529 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1529 are further described hereinbelow with reference to Table 1.

[52598] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1529 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1529 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52599] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1529 gene, herein designated VGAM is inhibition of expression of VGAM1529 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1529 correlate with, and may be deduced from, the identity of the target genes which VGAM1529 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52600] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is a VGAM1529 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45216, to the nucleotide sequence of VGAM1529 RNA, herein designated VGAM RNA, also designated SEQ ID:4240.

[52601] A function of VGAM1529 is therefore inhibition of Hepa-

toocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549) is another VGAM1529 host target gene. C20orf43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf43 BINDING SITE, designated SEQ ID:30113, to the nucleotide sequence of VGAM1529 RNA, herein designated VGAM RNA, also designated SEQ ID:4240.

[52602] Another function of VGAM1529 is therefore inhibition of Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549). Accordingly, utilities of VGAM1529

include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf43.

KIAA1559 (Accession XM\_054472) is another VGAM1529 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36160, to the nucleotide sequence of VGAM1529 RNA, herein designated VGAM RNA, also designated SEQ ID:4240.

[52603] Another function of VGAM1529 is therefore inhibition of KIAA1559 (Accession XM\_054472). Accordingly, utilities of VGAM1529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. LOC152179 (Accession XM\_098170) is another VGAM1529 host target gene. LOC152179 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC152179 BINDING SITE, designated SEQ ID:41431, to the nucleotide sequence of VGAM1529 RNA, herein designated VGAM RNA, also designated SEQ ID:4240.

[52604] Another function of VGAM1529 is therefore inhibition of LOC152179 (Accession XM\_098170). Accordingly, utilities of VGAM1529 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1530 (VGAM1530) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52605] VGAM1530 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1530 was detected is described hereinabove with reference to Figs. 1–8.

[52606] VGAM1530 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus. VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52607] VGAM1530 gene encodes a VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1530 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1530 precursor RNA is designated SEQ ID:1516, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1516 is located at position 73081 relative to the genome of Ectromelia Virus.

[52608] VGAM1530 precursor RNA folds onto itself, forming VGAM1530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52609] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1530 folded precursor RNA into VGAM1530 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1530 RNA is designated SEQ ID:4241, and is provided hereinbelow with reference to the sequence listing part.

[52610] VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1530 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52611] VGAM1530 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1530 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1530 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52612] The complementary binding of VGAM1530 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1530 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1530 host target RNA into VGAM1530 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52613] It is appreciated that VGAM1530 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1530 host target genes. The mRNA of each one of this plurality of VGAM1530 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1530 RNA, herein designated VGAM RNA, and which when bound by VGAM1530 RNA causes inhibition of translation of respective one or more VGAM1530 host target proteins.

[52614] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1530 gene, herein designated VGAM GENE, on one or more VGAM1530 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[52615] It is yet further appreciated that a function of VGAM1530 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1530 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1530 correlate with, and may be deduced from, the identity of the host target genes which VGAM1530 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52616] Nucleotide sequences of the VGAM1530 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1530 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1530 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1530 are further described hereinbelow with reference to Table 1.

[52617] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1530 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1530 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52618] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1530 gene, herein designated VGAM is inhibition of expression of VGAM1530 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1530 correlate with, and may be deduced from, the identity of the target genes which VGAM1530 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52619] KIAA0429 (Accession NM\_014751) is a VGAM1530 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16467, to the nucleotide sequence of VGAM1530 RNA, herein designated VGAM RNA, also designated SEQ ID:4241.

[52620] A function of VGAM1530 is therefore inhibition of

KIAA0429 (Accession NM\_014751). Accordingly, utilities of VGAM1530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. Protocadherin 17 (PCDH17, Accession NM\_014459) is another VGAM1530 host target gene. PCDH17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH17 BINDING SITE, designated SEQ ID:15812, to the nucleotide sequence of VGAM1530 RNA, herein designated VGAM RNA, also designated SEQ ID:4241.

[52621] Another function of VGAM1530 is therefore inhibition of Protocadherin 17 (PCDH17, Accession NM\_014459). Accordingly, utilities of VGAM1530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH17. LOC256806 (Accession XM\_172865) is another VGAM1530 host target gene. LOC256806 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256806, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256806 BINDING SITE, designated SEQ ID:46143, to the nucleotide sequence of VGAM1530 RNA, herein designated VGAM RNA, also designated SEQ ID:4241.

[52622] Another function of VGAM1530 is therefore inhibition of LOC256806 (Accession XM\_172865). Accordingly, utilities of VGAM1530 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256806. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1531 (VGAM1531) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52623] VGAM1531 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1531 was detected is described hereinabove with reference to Figs. 1–8.

[52624] VGAM1531 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ectromelia Virus.

VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52625] VGAM1531 gene encodes a VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1531 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1531 precursor RNA is designated SEQ ID:1517, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1517 is located at position 66901 relative to the genome of Ectromelia Virus.

[52626] VGAM1531 precursor RNA folds onto itself, forming VGAM1531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52627] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1531 folded precursor RNA into VGAM1531 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM1531 RNA is designated SEQ ID:4242, and is provided hereinbelow with reference to the sequence listing part.

[52628] VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1531 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52629] VGAM1531 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1531 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1531 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52630] The complementary binding of VGAM1531 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1531 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1531 host target RNA into VGAM1531 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52631] It is appreciated that VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1531 host target genes. The mRNA of each one of this plurality of VGAM1531 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1531 RNA, herein designated VGAM RNA, and which when bound by VGAM1531 RNA causes inhibition of translation of respective one or more VGAM1531 host target proteins.

[52632] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1531 gene, herein designated VGAM GENE, on one or more VGAM1531 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52633] It is yet further appreciated that a function of VGAM1531 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of viral infection by Ectromelia Virus. Specific functions, and accordingly utilities, of VGAM1531 correlate with, and may be deduced from, the identity of the host target genes which VGAM1531 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52634] Nucleotide sequences of the VGAM1531 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1531 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1531 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1531 are further described hereinbelow with reference to Table 1.

[52635] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1531 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1531 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52636] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1531 gene, herein designated VGAM is inhibition of expression of VGAM1531 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1531 correlate with, and may be deduced from, the identity of the target genes which VGAM1531 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52637] Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347) is a VGAM1531 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ ID:9361, to the

nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52638] A function of VGAM1531 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215.ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672) is another VGAM1531 host target gene. ABCA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ABCA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA5 BINDING SITE, designated SEQ ID:20745, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52639] Another function of VGAM1531 is therefore inhibition of

ATP-binding Cassette, Sub-family A (ABC1), Member 5 (ABCA5, Accession NM\_018672). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA5. DKFZP434B103 (Accession NM\_015644) is another VGAM1531 host target gene. DKFZP434B103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434B103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B103 BINDING SITE, designated SEQ ID:17895, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52640] Another function of VGAM1531 is therefore inhibition of DKFZP434B103 (Accession NM\_015644). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434B103. FLJ13693 (Accession NM\_024807) is another VGAM1531 host target gene. FLJ13693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13693, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13693 BINDING SITE, designated SEQ ID:24188, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52641] Another function of VGAM1531 is therefore inhibition of FLJ13693 (Accession NM\_024807). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13693. FLJ20699 (Accession NM\_017931) is another VGAM1531 host target gene. FLJ20699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20699 BINDING SITE, designated SEQ ID:19619, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52642] Another function of VGAM1531 is therefore inhibition of FLJ20699 (Accession NM\_017931). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ20699. Potassium Voltage-gated Channel, Isk-related Family, Member 4 (KCNE4, Accession NM\_080671) is another VGAM1531 host target gene. KCNE4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNE4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNE4 BINDING SITE, designated SEQ ID:27968, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52643] Another function of VGAM1531 is therefore inhibition of Potassium Voltage-gated Channel, Isk-related Family, Member 4 (KCNE4, Accession NM\_080671). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNE4. LOC147976 (Accession XM\_085980) is another VGAM1531 host target gene. LOC147976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC147976 BINDING SITE, designated SEQ ID:38431, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52644] Another function of VGAM1531 is therefore inhibition of LOC147976 (Accession XM\_085980). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147976. LOC51236 (Accession NM\_016458) is another VGAM1531 host target gene. LOC51236 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51236, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51236 BINDING SITE, designated SEQ ID:18575, to the nucleotide sequence of VGAM1531 RNA, herein designated VGAM RNA, also designated SEQ ID:4242.

[52645] Another function of VGAM1531 is therefore inhibition of LOC51236 (Accession NM\_016458). Accordingly, utilities of VGAM1531 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51236. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1532 (VGAM1532) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52646] VGAM1532 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1532 was detected is described hereinabove with reference to Figs. 1–8.

[52647] VGAM1532 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52648] VGAM1532 gene encodes a VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1532 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1532 precursor RNA is designated SEQ ID:1518, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1518 is located at position 83358 relative to the genome of Cowpox Virus.

[52649] VGAM1532 precursor RNA folds onto itself, forming VGAM1532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52650] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1532 folded precursor RNA into VGAM1532 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1532 RNA is designated SEQ ID:4243, and is provided hereinbelow with reference to the sequence listing part.

[52651] VGAM1532 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1532 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52652] VGAM1532 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1532 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1532 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1532 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52653] The complementary binding of VGAM1532 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1532 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1532 host target RNA into VGAM1532 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52654] It is appreciated that VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1532 host target genes. The mRNA of each one of this plurality of VGAM1532 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1532 RNA, herein designated VGAM RNA, and which when bound by VGAM1532 RNA causes inhibition of translation of respective one or more

VGAM1532 host target proteins.

[52655] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1532 gene, herein designated VGAM GENE, on one or more VGAM1532 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52656] It is yet further appreciated that a function of VGAM1532 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1532 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific

functions, and accordingly utilities, of VGAM1532 correlate with, and may be deduced from, the identity of the host target genes which VGAM1532 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52657] Nucleotide sequences of the VGAM1532 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1532 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1532 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1532 are further described hereinbelow with reference to Table 1.

[52658] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1532 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1532 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52659] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1532 gene, herein designated VGAM is inhibition of expression of VGAM1532 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1532 correlate with, and may be deduced from, the identity of the target genes which VGAM1532 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52660] Dual Specificity Phosphatase 10 (DUSP10, Accession NM\_007207) is a VGAM1532 host target gene. DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DUSP10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2, designated SEQ ID:14071 and SEQ ID:29555 respectively, to the nucleotide sequence of VGAM1532 RNA, herein designated VGAM RNA, also designated SEQ ID:4243.

[52661] A function of VGAM1532 is therefore inhibition of Dual Specificity Phosphatase 10 (DUSP10, Accession NM\_007207). Accordingly, utilities of VGAM1532 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP10. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to

here as Viral Genomic Address Messenger 1533 (VGAM1533) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52662] VGAM1533 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1533 was detected is described hereinabove with reference to Figs. 1–8.

[52663] VGAM1533 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52664] VGAM1533 gene encodes a VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1533 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1533 precursor RNA is designated SEQ ID:1519, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1519 is located at position 82024 relative to the genome of Cowpox Virus.

[52665] VGAM1533 precursor RNA folds onto itself, forming VGAM1533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52666] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1533 folded precursor RNA into VGAM1533 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1533 RNA is designated SEQ ID:4244, and is provided hereinbelow with reference to the sequence listing part.

[52667] VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1533 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1533 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52668] VGAM1533 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1533 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1533 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52669] The complementary binding of VGAM1533 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1533 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1533 host target RNA into VGAM1533 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52670] It is appreciated that VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1533 host target genes. The mRNA of each one of this plurality of VGAM1533 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1533 RNA, herein designated VGAM RNA, and which when bound by VGAM1533 RNA causes inhibition of translation of respective one or more VGAM1533 host target proteins.

[52671] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1533 gene, herein designated VGAM GENE, on one or more VGAM1533 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52672] It is yet further appreciated that a function of VGAM1533 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1533 correlate with, and may be deduced from, the identity of the

host target genes which VGAM1533 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52673] Nucleotide sequences of the VGAM1533 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1533 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1533 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1533 are further described hereinbelow with reference to Table 1.

[52674] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1533 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1533 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52675] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1533 gene, herein designated VGAM is inhibition of expression of VGAM1533 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1533 correlate with, and may be deduced from, the identity of the target genes which VGAM1533

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52676] Ceroid–lipofuscinosis, Neuronal 2, Late Infantile (Jansky–Bielschowsky disease) (CLN2, Accession NM\_000391) is a VGAM1533 host target gene. CLN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:5964, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52677] A function of VGAM1533 is therefore inhibition of Ceroid–lipofuscinosis, Neuronal 2, Late Infantile (Jansky–Bielschowsky disease) (CLN2, Accession NM\_000391). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 11 (CHL1–like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_030655) is another VGAM1533 host target gene. DDX11 BINDING SITE1 and DDX11 BINDING SITE2 are

HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX11 BINDING SITE1 and DDX11 BINDING SITE2, designated SEQ ID:24983 and SEQ ID:10651 respectively, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52678] Another function of VGAM1533 is therefore inhibition of DEAD/H (Asp–Glu–Ala–Asp/His) Box Polypeptide 11 (CHL1–like helicase homolog, *S. cerevisiae*) (DDX11, Accession NM\_030655), a gene which could be an ATP–dependent DNA–binding helicase and may intervene in cell cycle regulation. Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX11. The function of DDX11 has been established by previous studies. Helicases are essential components of a number of multi–protein complexes, including those that regulate transcription, splicing, translation, and DNA repair. These enzymes assist in the unwinding of double–stranded DNA and RNA as an essential part of their function. DEAD box

proteins are putative RNA helicases that have a characteristic Asp-Glu-Ala-Asp (DEAD) box as 1 of 8 highly conserved sequence motifs. See 600396. The yeast Chl1 gene encodes a putative helicase that appears to be essential for normal chromosome transmission. Amann et al.

(1996) studied 2 human genes related to the Chl1 gene of *Saccharomyces cerevisiae*: CHLR1 and CHLR2 (OMIM Ref. No. 601151). The open reading frames (ORFs) of these genes encode proteins with a predicted molecular weight of 102 kD, and the in vitro transcribed and translated products bind efficiently to single-stranded DNA. The predicted ORFs of these 2 genes are more than 98% identical, suggesting that they may have redundant functions. The genes were localized to 12p11 and 12p13 by analysis of somatic cell hybrids and fluorescence in situ hybridization. Fluorescence in situ hybridization indicated that the 2 CHLR gene loci are physically distinct and separated by 8 to 12 Mb. Others had reported the duplication of this region of 12p involving a human expressed sequence tag (EST) and 2 previously uncharacterized cDNAs, which Amann et al. (1996) showed were, in fact, the CHLR genes. A comparison of the CHLR gene sequences with available databases indicated that a large proportion of these

genes, including exons encoding 2 functional domains of the carboxyl-terminal region, had been duplicated as part of a large human telomeric repeat sequence found on many human chromosomes. The results suggested to the authors that duplication of a relatively large region of chromosome 12p containing this putative helicase gene has resulted in the creation of numerous pseudogenes as part of a subtelomeric repeat. Amann et al. (1996) stated that the presence of these helicase pseudogenes, as well as pseudogenes for other genes such as the interleukin-9 receptor (OMIM Ref. No. 300007), within many subtelomeric regions supported the possibility that the spread of this region is subject to exchange between different chromosomes and may have implications for elucidation of the mechanism of intra- and interchromosomal duplication events. Frank and Werner (1996) used differential display PCR to identify novel cDNAs in keratinocytes whose expression is regulated by keratinocyte growth factor (KGF; 148180). One such clone, termed KRG2 by the authors, was identified, and a full-length cDNA was cloned from a KGF-stimulated keratinocyte cDNA library. Southern blot analysis suggested that KRG2 is a member of a multigene family. Northern blot analysis revealed a single 4.3-kb

mRNA whose expression is upregulated by KGF. The authors used RNase protection assays to determine that serum, EGF, and cytokine IL-1-beta (OMIM Ref. No. 147720) had no effect on KRG2 expression, while inhibitors of keratinocyte proliferation, such as TGF-beta-1 (OMIM Ref. No. 190180) and TNF-alpha (OMIM Ref. No. 191160), caused a slight reduction in KRG2 expression. Sequence analysis indicated that the KRG2 cDNA encodes an 856-amino acid protein that is 32% identical to the yeast gene CHL1. Frank and Werner (1996) hypothesized that KRG2 may be involved in cell cycle regulation.

[52679] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52682] Further studies establishing the function and utilities of DDX11 are found in John Hopkins OMIM database record

ID 601150, and in cited publications numbered 7541–7543 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM\_004447) is another VGAM1533 host target gene. EPS8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EPS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS8 BINDING SITE, designated SEQ ID:10743, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52683] Another function of VGAM1533 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM\_004447), a gene which has a role in normal and neoplastic cell proliferation; contains an SH3 motif. Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS8. The function of EPS8 has been established by previous studies. Using an expression cloning approach for the study of epidermal growth factor

(EGF) receptor (EGFR; 131550)–activated signaling, Wong et al. (1994) found a number of murine cDNA clones referred to as eps, for egfr–pathway–substrate. (See 600051 for one of these, EPS15.) One of the clones encoded a protein of 97 kD, designated eps8, which was phosphorylated in vivo by several receptor tyrosine kinases (Fazioli et al., 1993). In addition to a previously identified SH3 domain, Wong et al. (1994) found that the predicted amino acid sequence of human EPS8 showed a nonrandom distribution of prolines, clustered in a way to suggest SH3–binding sites and a putative PH domain. EPS8 was expressed in all epithelial and fibroblast cell lines examined and in some, but not all, hematopoietic cells. An essential function of EPS8 in cell growth regulation was underscored by its conservation during evolution where EPS8–related sequences were detected as early as in *S. cerevisiae*. EGFR signaling involves small GTPases of the Rho family, and EGFR trafficking involves small GTPases of the Rab family. Lanzetti et al. (2000) reported that the EPS8 protein connects these signaling pathways. EPS8 is a substrate of EGFR that is held in a complex with SOS1 by the adaptor protein E3B1, thereby mediating activation of RAC. Through its SH3 domain, EPS8 interacts with RNTRE

(OMIM Ref. No. 605405). Lanzetti et al. (2000) showed that RNTRE is a RAB5 (OMIM Ref. No. 179512) GTPase-activating protein whose activity is regulated by EGFR. By entering in a complex with EPS8, RNTRE acts on RAB5 and inhibits internalization of the EGFR. Furthermore, RNTRE diverts EPS8 from its RAC-activating function, resulting in the attenuation of RAC signaling. Thus, depending on its state of association with E3B1 or RNTRE, EPS8 participates in both EGFR signaling through RAC and EGFR trafficking through RAB5. Wong et al. (1994) mapped the human EPS8 locus to 12q23-q24 by study of human-rodent somatic cell hybrid DNAs and by fluorescence in situ hybridization. In an study of candidate genes for Noonan syndrome (OMIM Ref. No. 163950), Ion et al. (2000) reassigned the map position of EPS8 to 12q13 using FISH.

[52684] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52685] Wong, W. T.; Carlomagno, F.; Druck, T.; Barletta, C.; Croce, C. M.; Huebner, K.; Kraus, M. H.; Di Fiore, P. P. : Evolutionary conservation of the EPS8 gene and its mapping to human chromosome 12q23-q24. *Oncogene* 9: 3057-3061, 1994. ; and

[52687] Further studies establishing the function and utilities of EPS8 are found in John Hopkins OMIM database record ID 600206, and in cited publications numbered 1591, 199 and 2125 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Coagulation Factor VII (serum prothrombin conversion accelerator) (F7, Accession NM\_019616) is another VGAM1533 host target gene. F7 BINDING SITE1 and F7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by F7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F7 BINDING SITE1 and F7 BINDING SITE2, designated SEQ ID:21237 and SEQ ID:5608 respectively, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52688] Another function of VGAM1533 is therefore inhibition of Coagulation Factor VII (serum prothrombin conversion ac-

celerator) (F7, Accession NM\_019616). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F7. Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024) is another VGAM1533 host target gene. FMR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMR1 BINDING SITE, designated SEQ ID:7775, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52689] Another function of VGAM1533 is therefore inhibition of Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR1. LFG (Accession XM\_084780) is another VGAM1533 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37687, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52690] Another function of VGAM1533 is therefore inhibition of LFG (Accession XM\_084780). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Orthodenticle Homolog 1 (Drosophila) (OTX1, Accession NM\_014562) is another VGAM1533 host target gene. OTX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OTX1 BINDING SITE, designated SEQ ID:15898, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52691] Another function of VGAM1533 is therefore inhibition of Orthodenticle Homolog 1 (Drosophila) (OTX1, Accession NM\_014562), a gene which plays a role in the development of the brain and the sense organs. Accordingly, utilities of VGAM1533 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with OTX1. The function of OTX1 has been established by previous studies. OTX1 is a homeobox family gene related to a gene expressed in the developing *Drosophila* head termed 'orthodenticle.' Simeone et al. (1992) identified rodent OTX2 (OMIM Ref. No. 600037). A homolog is also found in the zebrafish. Tissue expression of OTX1 is similar to that of OTX2 but is more restricted (Boncinelli et al., 1993). Frantz et al. (1994) showed that *Otx1* mRNA was expressed by precursors of deep-layer neurons within cortical layers 5 and 6 of the rat brain during both postnatal and adult life. Using a cosmid containing the gene, Kastury et al. (1994) mapped human OTX1 to 2p13 by fluorescence in situ hybridization, near the locus for EMX1 (OMIM Ref. No. 600034). Animal model experiments lend further support to the function of OTX1. Acampora et al. (1996) produced null mice by replacing *Otx1* with the lacZ gene. *Otx* <sup>-/-</sup> mice exhibited epileptic behavior with the characteristics of both focal and generalized seizures. Anatomic and histologic analyses of brains from 2-4-month-old *Otx* <sup>-/-</sup> mice revealed multiple abnormalities affecting mainly the telencephalic, temporal, and perirhinal areas, the hippocampus, mesencephalon, and

cerebellum, and the acoustic and visual sense organs. Acampora et al. (1996) reported that in older Otx  $-/-$  mice the epileptic behavior and frequency of seizures were somewhat reduced, although they never disappeared. They detected neither epileptic behavior nor electrical seizures in Otx $+/(-)$  mice. The authors stated that this study provides the first evidence that loss of function of a homeobox-containing gene affects brain development and induces spontaneous epilepsy.

[52692] It is appreciated that the abovementioned animal model for OTX1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[52693] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52694] Frantz, G. D.; Weimann, J. M.; Levin, M. E.; McConnell, S. K. : Otx1 and Otx2 define layers and regions in developing cerebral cortex and cerebellum. J. Neurosci. 14: 5725–5740, 1994. ; and

[52695] Acampora, D.; Mazan, S.; Avantaggiato, V.; Barone, P.; Tuorto, F.; Lallemand, Y.; Brulet, P.; Simeone, A. : Epilepsy and brain abnormalities in mice lacking the Otx1 gene.

Nature Genet.

[52696] Further studies establishing the function and utilities of OTX1 are found in John Hopkins OMIM database record ID 600036, and in cited publications numbered 8116–811 and 8110–8111 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Synaptosomal–associated Protein, 23kDa (SNAP23, Accession NM\_003825) is another VGAM1533 host target gene. SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SNAP23, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAP23 BINDING SITE1 and SNAP23 BINDING SITE2, designated SEQ ID:9919 and SEQ ID:28284 respectively, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52697] Another function of VGAM1533 is therefore inhibition of Synaptosomal–associated Protein, 23kDa (SNAP23, Accession NM\_003825), a gene which is essential component of the high affinity receptor for the general membrane fusion machinery. Accordingly, utilities of VGAM1533 include di–

agnosis, prevention and treatment of diseases and clinical conditions associated with SNAP23. The function of SNAP23 has been established by previous studies. Synaptosomal-associated proteins (SNAPs) are involved in the process of membrane fusion in intracellular vesicle traffic. By fluorescence in situ hybridization, Lazo et al. (2001) mapped the SNAP23 gene to chromosome 15q21-q22. Lazo et al. (2001) suggested that alterations in the SNAP23 gene may be involved in neurologic and other diseases with defects in vesicle-membrane fusion processes that map to 15q15-q21.

[52698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[52699] Lazo, P. A.; Nadal, M.; Ferrer, M.; Area, E.; Hernandez-Torres, J.; Nabokina, S. M.; Mollinedo, F.; Estivill, X. : Genomic organization, chromosomal localization, alternative splicing, and isoforms of the human synaptosome-associated protein-23 gene implicated in vesicle-membrane fusion processes. [52700] Mollinedo, F.; Lazo, P. A. : Identification of two isoforms of the vesicle-membrane fusion protein SNAP-23 in human neutrophils and HL-60 cells. Biochem. Biophys. Res. Com-

mun. 231: 808.

[52701] Further studies establishing the function and utilities of SNAP23 are found in John Hopkins OMIM database record ID 602534, and in cited publications numbered 8872–8876 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM\_005100) is another VGAM1533 host target gene. AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2, designated SEQ ID:11572 and SEQ ID:29312 respectively, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52702] Another function of VGAM1533 is therefore inhibition of A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM\_005100). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP12. DEAD/H

(Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936) is another VGAM1533 host target gene. DDX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX12 BINDING SITE, designated SEQ ID:30021, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52703] Another function of VGAM1533 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 12 (CHL1-like helicase homolog, *S. cerevisiae*) (DDX12, Accession XM\_006936). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX12. ERO1-like (*S. cerevisiae*) (ERO1L, Accession NM\_014584) is another VGAM1533 host target gene. ERO1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERO1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERO1L BINDING SITE, designated SEQ ID:15940, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52704] Another function of VGAM1533 is therefore inhibition of ERO1-like (*S. cerevisiae*) (ERO1L, Accession NM\_014584). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERO1L. FLJ11413 (Accession NM\_024554) is another VGAM1533 host target gene. FLJ11413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11413 BINDING SITE, designated SEQ ID:23772, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52705] Another function of VGAM1533 is therefore inhibition of FLJ11413 (Accession NM\_024554). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with FLJ11413. FLJ20040 (Accession NM\_018992) is another VGAM1533 host target gene. FLJ20040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20040 BINDING SITE, designated SEQ ID:21066, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52706] Another function of VGAM1533 is therefore inhibition of FLJ20040 (Accession NM\_018992). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20040. FLJ20772 (Accession NM\_017956) is another VGAM1533 host target gene. FLJ20772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20772 BINDING SITE, designated SEQ ID:19665, to the nucleotide

sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52707] Another function of VGAM1533 is therefore inhibition of FLJ20772 (Accession NM\_017956). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20772. FLJ30574 (Accession NM\_144629) is another VGAM1533 host target gene. FLJ30574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30574 BINDING SITE, designated SEQ ID:29447, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52708] Another function of VGAM1533 is therefore inhibition of FLJ30574 (Accession NM\_144629). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30574. FLJ31168 (Accession NM\_144712) is another VGAM1533 host target gene. FLJ31168 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ31168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31168 BINDING SITE, designated SEQ ID:29536, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52709] Another function of VGAM1533 is therefore inhibition of FLJ31168 (Accession NM\_144712). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31168. G Antigen, Family D, 3 (GAGED3, Accession NM\_130777) is another VGAM1533 host target gene. GAGED3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAGED3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAGED3 BINDING SITE, designated SEQ ID:28268, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52710] Another function of VGAM1533 is therefore inhibition of G

Antigen, Family D, 3 (GAGED3, Accession NM\_130777). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAGED3. IDI2 (Accession NM\_033261) is another VGAM1533 host target gene. IDI2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDI2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDI2 BINDING SITE, designated SEQ ID:27091, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52711] Another function of VGAM1533 is therefore inhibition of IDI2 (Accession NM\_033261). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDI2. IPLA2(GAMMA) (Accession XM\_027224) is another VGAM1533 host target gene. IPLA2(GAMMA) BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IPLA2(GAMMA), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of IPLA2(GAMMA) BINDING SITE, designated SEQ ID:30444, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52712] Another function of VGAM1533 is therefore inhibition of IPLA2(GAMMA) (Accession XM\_027224). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPLA2(GAMMA). KIAA0737 (Accession NM\_014828) is another VGAM1533 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:16820, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52713] Another function of VGAM1533 is therefore inhibition of KIAA0737 (Accession NM\_014828). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. KIAA0870 (Accession XM\_088315) is another

VGAM1533 host target gene. KIAA0870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0870 BINDING SITE, designated SEQ ID:39609, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52714] Another function of VGAM1533 is therefore inhibition of KIAA0870 (Accession XM\_088315). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0870. KIAA1028 (Accession XM\_166324) is another VGAM1533 host target gene. KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:44160, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52715] Another function of VGAM1533 is therefore inhibition of KIAA1028 (Accession XM\_166324). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. KIAA1357 (Accession XM\_050421) is another VGAM1533 host target gene. KIAA1357 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1357 BINDING SITE, designated SEQ ID:35629, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52716] Another function of VGAM1533 is therefore inhibition of KIAA1357 (Accession XM\_050421). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1357. KIAA1617 (Accession XM\_166140) is another VGAM1533 host target gene. KIAA1617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1617, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1617 BINDING SITE, designated SEQ ID:43941, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52717] Another function of VGAM1533 is therefore inhibition of KIAA1617 (Accession XM\_166140). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1617. Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054) is another VGAM1533 host target gene. LHFPL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHFPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFPL2 BINDING SITE, designated SEQ ID:34660, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52718] Another function of VGAM1533 is therefore inhibition of Lipoma HMGIC Fusion Partner-like 2 (LHFPL2, Accession XM\_046054). Accordingly, utilities of VGAM1533 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFPL2. Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010) is another VGAM1533 host target gene. MAP2K4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP2K4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K4 BINDING SITE, designated SEQ ID:8914, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52719] Another function of VGAM1533 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 4 (MAP2K4, Accession NM\_003010). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K4. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889) is another VGAM1533 host target gene. PCQAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:18031, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52720] Another function of VGAM1533 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975) is another VGAM1533 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12597, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52721] Another function of VGAM1533 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession

NM\_005975). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. RODH-4 (Accession NM\_003708) is another VGAM1533 host target gene.

RODH-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RODH-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RODH-4 BINDING SITE, designated SEQ ID:9809, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52722] Another function of VGAM1533 is therefore inhibition of RODH-4 (Accession NM\_003708). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH-4. Testis Specific, 14 (TSGA14, Accession NM\_018718) is another VGAM1533 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSGA14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:20794, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52723] Another function of VGAM1533 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM\_018718). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. Wingless-type MMTV Integration Site Family, Member 16 (WNT16, Accession NM\_057168) is another VGAM1533 host target gene. WNT16 BINDING SITE1 and WNT16 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT16, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT16 BINDING SITE1 and WNT16 BINDING SITE2, designated SEQ ID:27674 and SEQ ID:18170 respectively, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52724] Another function of VGAM1533 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 16

(WNT16, Accession NM\_057168). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT16. LOC144373 (Accession XM\_084841) is another VGAM1533 host target gene. LOC144373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144373 BINDING SITE, designated SEQ ID:37726, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52725] Another function of VGAM1533 is therefore inhibition of LOC144373 (Accession XM\_084841). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144373. LOC146728 (Accession XM\_097074) is another VGAM1533 host target gene. LOC146728 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146728 BINDING SITE, designated SEQ ID:40723, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52726] Another function of VGAM1533 is therefore inhibition of LOC146728 (Accession XM\_097074). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146728. LOC149566 (Accession XM\_097670) is another VGAM1533 host target gene. LOC149566 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149566 BINDING SITE, designated SEQ ID:41016, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52727] Another function of VGAM1533 is therefore inhibition of LOC149566 (Accession XM\_097670). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149566. LOC150113 (Accession XM\_104532) is an-

other VGAM1533 host target gene. LOC150113 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150113 BINDING SITE, designated SEQ ID:42167, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52728] Another function of VGAM1533 is therefore inhibition of LOC150113 (Accession XM\_104532). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150113. LOC151414 (Accession XM\_087197) is another VGAM1533 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:39109, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52729] Another function of VGAM1533 is therefore inhibition of LOC151414 (Accession XM\_087197). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. LOC158427 (Accession NM\_139246) is another VGAM1533 host target gene. LOC158427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158427 BINDING SITE, designated SEQ ID:29246, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52730] Another function of VGAM1533 is therefore inhibition of LOC158427 (Accession NM\_139246). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158427. LOC197196 (Accession XM\_117003) is another VGAM1533 host target gene. LOC197196 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197196, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197196 BINDING SITE, designated SEQ ID:43199, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52731] Another function of VGAM1533 is therefore inhibition of LOC197196 (Accession XM\_117003). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197196. LOC199699 (Accession XM\_113990) is another VGAM1533 host target gene. LOC199699 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199699, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199699 BINDING SITE, designated SEQ ID:42594, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52732] Another function of VGAM1533 is therefore inhibition of LOC199699 (Accession XM\_113990). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199699. LOC219401 (Accession XM\_166706) is another VGAM1533 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44591, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52733] Another function of VGAM1533 is therefore inhibition of LOC219401 (Accession XM\_166706). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC256112 (Accession XM\_172829) is another VGAM1533 host target gene. LOC256112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256112 BINDING SITE, designated SEQ ID:46103, to the nucleotide sequence of VGAM1533 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4244.

[52734] Another function of VGAM1533 is therefore inhibition of LOC256112 (Accession XM\_172829). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256112. LOC91464 (Accession XM\_038589) is another VGAM1533 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:32876, to the nucleotide sequence of VGAM1533 RNA, herein designated VGAM RNA, also designated SEQ ID:4244.

[52735] Another function of VGAM1533 is therefore inhibition of LOC91464 (Accession XM\_038589). Accordingly, utilities of VGAM1533 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1534 (VGAM1534) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52736] VGAM1534 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1534 was detected is described hereinabove with reference to Figs. 1–8.

[52737] VGAM1534 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52738] VGAM1534 gene encodes a VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1534 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1534 precursor RNA is designated SEQ ID:1520, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1520 is located at position 80718 relative to the genome of Cowpox Virus.

[52739] VGAM1534 precursor RNA folds onto itself, forming

VGAM1534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52740] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1534 folded precursor RNA into VGAM1534 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1534 RNA is designated SEQ ID:4245, and is provided hereinbelow with reference to the sequence listing part.

[52741] VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1534 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52742] VGAM1534 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1534 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1534 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52743] The complementary binding of VGAM1534 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1534 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1534 host target RNA into VGAM1534 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52744] It is appreciated that VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1534 host target genes. The mRNA of each one of this plurality of VGAM1534 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1534 RNA, herein designated VGAM RNA, and which when bound by VGAM1534 RNA causes inhibition of translation of respective one or more VGAM1534 host target proteins.

[52745] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1534 gene, herein designated VGAM GENE, on one or more VGAM1534 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52746] It is yet further appreciated that a function of VGAM1534 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1534 correlate with, and may be deduced from, the identity of the host target genes which VGAM1534 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[52747] Nucleotide sequences of the VGAM1534 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1534 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1534 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1534 are further described hereinbelow with reference to Table 1.

[52748] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1534 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1534 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52749] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1534 gene, herein designated VGAM is inhibition of expression of VGAM1534 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1534 correlate with, and may be deduced from, the identity of the target genes which VGAM1534 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[52750] Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373) is a VGAM1534 host target gene. MAP1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1A BINDING SITE, designated SEQ ID:8181, to the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, also designated SEQ ID:4245.

[52751] A function of VGAM1534 is therefore inhibition of Microtubule-associated Protein 1A (MAP1A, Accession NM\_002373), a gene which is a structural protein involved in the filamentous cross-bridging between microtubules and other skeletal elements. Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1A. The function of MAP1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315.MGC20253 (Accession NM\_144583) is another VGAM1534 host target gene. MGC20253 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20253 BINDING SITE, designated SEQ ID:29394, to the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, also designated SEQ ID:4245.

[52752] Another function of VGAM1534 is therefore inhibition of MGC20253 (Accession NM\_144583). Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20253. LOC120856 (Accession XM\_058509) is another VGAM1534 host target gene. LOC120856 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC120856, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120856 BINDING SITE, designated SEQ ID:36635, to the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, also designated SEQ ID:4245.

[52753] Another function of VGAM1534 is therefore inhibition of

LOC120856 (Accession XM\_058509). Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120856. LOC143425 (Accession XM\_113695) is another VGAM1534 host target gene. LOC143425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143425 BINDING SITE, designated SEQ ID:42347, to the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, also designated SEQ ID:4245.

[52754] Another function of VGAM1534 is therefore inhibition of LOC143425 (Accession XM\_113695). Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143425. LOC201685 (Accession XM\_117325) is another VGAM1534 host target gene. LOC201685 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201685, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201685 BINDING SITE, designated SEQ ID:43385, to the nucleotide sequence of VGAM1534 RNA, herein designated VGAM RNA, also designated SEQ ID:4245.

[52755] Another function of VGAM1534 is therefore inhibition of LOC201685 (Accession XM\_117325). Accordingly, utilities of VGAM1534 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201685. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1535 (VGAM1535) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52756] VGAM1535 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1535 was detected is described hereinabove with reference to Figs. 1–8.

[52757] VGAM1535 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus.

VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[52758] VGAM1535 gene encodes a VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1535 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1535 precursor RNA is designated SEQ ID:1521, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1521 is located at position 80457 relative to the genome of Cowpox Virus.

[52759] VGAM1535 precursor RNA folds onto itself, forming VGAM1535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52760] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1535 folded precursor RNA into VGAM1535 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide sequence of VGAM1535 RNA is designated SEQ ID:4246, and is provided hereinbelow with reference to the sequence listing part.

[52761] VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1535 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52762] VGAM1535 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1535 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1535 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52763] The complementary binding of VGAM1535 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1535 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1535 host target RNA into VGAM1535 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52764] It is appreciated that VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1535 host target genes. The mRNA of each one of this plurality of VGAM1535 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1535 RNA, herein designated VGAM RNA, and which when bound by VGAM1535 RNA causes inhibition of translation of respective one or more VGAM1535 host target proteins.

[52765] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1535 gene, herein designated VGAM GENE, on one or more VGAM1535 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52766] It is yet further appreciated that a function of VGAM1535 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1535 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1535 correlate with, and may be deduced from, the identity of the host target genes which VGAM1535 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52767] Nucleotide sequences of the VGAM1535 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1535 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1535 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1535 are further described hereinbelow with reference to Table 1.

[52768] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1535 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1535 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52769] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1535 gene, herein designated VGAM is inhibition of expression of VGAM1535 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1535 correlate with, and may be deduced from, the identity of the target genes which VGAM1535 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52770] Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM\_012281) is a VGAM1535 host target gene. KCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCND2 BINDING SITE, designated SEQ ID:14605, to the nucleotide sequence of VGAM1535 RNA, herein designated VGAM RNA,

also designated SEQ ID:4246.

[52771] A function of VGAM1535 is therefore inhibition of Potassium Voltage-gated Channel, Shal-related Subfamily, Member 2 (KCND2, Accession NM\_012281), a gene which is prominent in the repolarization phase of the action potential. Accordingly, utilities of VGAM1535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCND2. The function of KCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM449. Peripheral Myelin Protein 2 (PMP2, Accession NM\_002677) is another VGAM1535 host target gene.

PMP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMP2 BINDING SITE, designated SEQ ID:8542, to the nucleotide sequence of VGAM1535 RNA, herein designated VGAM RNA, also designated SEQ ID:4246.

[52772] Another function of VGAM1535 is therefore inhibition of Peripheral Myelin Protein 2 (PMP2, Accession

NM\_002677), a gene which is a lipid transport protein in schwann cells. Accordingly, utilities of VGAM1535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP2. The function of PMP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. KIAA1229 (Accession XM\_030665) is another VGAM1535 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31093, to the nucleotide sequence of VGAM1535 RNA, herein designated VGAM RNA, also designated SEQ ID:4246.

[52773] Another function of VGAM1535 is therefore inhibition of KIAA1229 (Accession XM\_030665). Accordingly, utilities of VGAM1535 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1536 (VGAM1536) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52774] VGAM1536 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1536 was detected is described hereinabove with reference to Figs. 1–8.

[52775] VGAM1536 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52776] VGAM1536 gene encodes a VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1536 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1536 precursor RNA is designated SEQ ID:1522, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1522 is located at position 77166 relative to the

genome of Cowpox Virus.

[52777] VGAM1536 precursor RNA folds onto itself, forming VGAM1536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52778] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1536 folded precursor RNA into VGAM1536 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1536 RNA is designated SEQ ID:4247, and is provided hereinbelow with reference to the sequence listing part.

[52779] VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1536 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52780] VGAM1536 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1536 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1536 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52781] The complementary binding of VGAM1536 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1536 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1536 host target RNA into VGAM1536 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52782] It is appreciated that VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1536 host target genes. The mRNA of each one of this plurality of VGAM1536 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1536 RNA, herein designated VGAM RNA, and which when bound by VGAM1536 RNA causes inhibition of translation of respective one or more VGAM1536 host target proteins.

[52783] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1536 gene, herein designated VGAM GENE, on one or more VGAM1536 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52784] It is yet further appreciated that a function of VGAM1536 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1536 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1536 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52785] Nucleotide sequences of the VGAM1536 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1536 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1536 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1536 are further described hereinbelow with reference to Table 1.

[52786] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1536 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1536 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52787] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1536 gene, herein designated VGAM is inhibition of expression of VGAM1536 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1536 correlate with, and may be deduced

from, the identity of the target genes which VGAM1536 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52788] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is a VGAM1536 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45216, to the nucleotide sequence of VGAM1536 RNA, herein designated VGAM RNA, also designated SEQ ID:4247.

[52789] A function of VGAM1536 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM174. Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549) is another VGAM1536 host target gene. C20orf43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf43 BINDING SITE, designated SEQ ID:30113, to the nucleotide sequence of VGAM1536 RNA, herein designated VGAM RNA, also designated SEQ ID:4247.

[52790] Another function of VGAM1536 is therefore inhibition of Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549). Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf43.

KIAA1559 (Accession XM\_054472) is another VGAM1536 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE,

designated SEQ ID:36160, to the nucleotide sequence of VGAM1536 RNA, herein designated VGAM RNA, also designated SEQ ID:4247.

[52791] Another function of VGAM1536 is therefore inhibition of KIAA1559 (Accession XM\_054472). Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. LOC152179 (Accession XM\_098170) is another VGAM1536 host target gene. LOC152179 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152179 BINDING SITE, designated SEQ ID:41431, to the nucleotide sequence of VGAM1536 RNA, herein designated VGAM RNA, also designated SEQ ID:4247.

[52792] Another function of VGAM1536 is therefore inhibition of LOC152179 (Accession XM\_098170). Accordingly, utilities of VGAM1536 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1537 (VGAM1537) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52793] VGAM1537 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1537 was detected is described hereinabove with reference to Figs. 1–8.

[52794] VGAM1537 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cowpox Virus. VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52795] VGAM1537 gene encodes a VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1537 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1537 precursor RNA is designated SEQ ID:1523, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1523 is located at position 78285 relative to the

genome of Cowpox Virus.

[52796] VGAM1537 precursor RNA folds onto itself, forming VGAM1537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52797] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1537 folded precursor RNA into VGAM1537 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1537 RNA is designated SEQ ID:4248, and is provided hereinbelow with reference to the sequence listing part.

[52798] VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1537 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[52799] VGAM1537 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1537 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1537 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[52800] The complementary binding of VGAM1537 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1537 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1537 host target RNA into VGAM1537 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52801] It is appreciated that VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1537 host target genes. The mRNA of each one of this plurality of VGAM1537 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1537 RNA, herein designated VGAM RNA, and which when bound by VGAM1537 RNA causes inhibition of translation of respective one or more VGAM1537 host target proteins.

[52802] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1537 gene, herein designated VGAM GENE, on one or more VGAM1537 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52803] It is yet further appreciated that a function of VGAM1537 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of viral infection by Cowpox Virus. Specific functions, and accordingly utilities, of VGAM1537 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1537 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52804] Nucleotide sequences of the VGAM1537 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1537 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1537 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1537 are further described hereinbelow with reference to Table 1.

[52805] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1537 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1537 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52806] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1537 gene, herein designated VGAM is inhibition of expression of VGAM1537 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1537 correlate with, and may be deduced

from, the identity of the target genes which VGAM1537 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52807] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649) is a VGAM1537 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7352, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52808] A function of VGAM1537 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Cockayne Syndrome 1 (classical) (CKN1, Ac-

cession NM\_000082) is another VGAM1537 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5529, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52809] Another function of VGAM1537 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is another VGAM1537 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9561, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM

RNA, also designated SEQ ID:4248.

[52810] Another function of VGAM1537 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Zinc Finger Protein 36 (K0X18) (ZNF36, Accession XM\_168302) is another VGAM1537 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45101, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52811] Another function of VGAM1537 is therefore inhibition of

Zinc Finger Protein 36 (K0X 18) (ZNF36, Accession XM\_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804.FLJ23191 (Accession NM\_024574) is another VGAM1537 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23803, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52812] Another function of VGAM1537 is therefore inhibition of FLJ23191 (Accession NM\_024574). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. KIAA0841 (Accession XM\_049237) is another

VGAM1537 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35359, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52813] Another function of VGAM1537 is therefore inhibition of KIAA0841 (Accession XM\_049237). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. Ring Finger Protein 20 (RNF20, Accession NM\_019592) is another VGAM1537 host target gene. RNF20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF20 BINDING SITE, designated SEQ ID:21213, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ

ID:4248.

[52814] Another function of VGAM1537 is therefore inhibition of Ring Finger Protein 20 (RNF20, Accession NM\_019592). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF20. LOC118851 (Accession XM\_061180) is another VGAM1537 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37199, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52815] Another function of VGAM1537 is therefore inhibition of LOC118851 (Accession XM\_061180). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC150005 (Accession XM\_097795) is another VGAM1537 host target gene. LOC150005 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:41122, to the nucleotide sequence of VGAM1537 RNA, herein designated VGAM RNA, also designated SEQ ID:4248.

[52816] Another function of VGAM1537 is therefore inhibition of LOC150005 (Accession XM\_097795). Accordingly, utilities of VGAM1537 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1538 (VGAM1538) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52817] VGAM1538 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1538 was detected is described hereinabove with reference to Figs. 1-8.

[52818] VGAM1538 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Monkeypox Virus.

VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52819] VGAM1538 gene encodes a VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1538 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1538 precursor RNA is designated SEQ ID:1524, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1524 is located at position 59766 relative to the genome of Monkeypox Virus.

[52820] VGAM1538 precursor RNA folds onto itself, forming VGAM1538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52821] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1538 folded precursor RNA into VGAM1538 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1538 RNA is designated SEQ ID:4249, and is provided hereinbelow with reference to the sequence listing part.

[52822] VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1538 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52823] VGAM1538 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1538 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1538 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52824] The complementary binding of VGAM1538 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1538 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1538

host target RNA into VGAM1538 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52825] It is appreciated that VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1538 host target genes. The mRNA of each one of this plurality of VGAM1538 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1538 RNA, herein designated VGAM RNA, and which when bound by VGAM1538 RNA causes inhibition of translation of respective one or more VGAM1538 host target proteins.

[52826] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1538 gene, herein designated VGAM GENE, on one or more VGAM1538 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52827] It is yet further appreciated that a function of VGAM1538 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1538 correlate with, and may be deduced from, the identity of the host target genes which VGAM1538 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52828] Nucleotide sequences of the VGAM1538 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1538 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1538 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1538 are further

described hereinbelow with reference to Table 1.

[52829] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1538 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1538 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52830] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1538 gene, herein designated VGAM is inhibition of expression of VGAM1538 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1538 correlate with, and may be deduced from, the identity of the target genes which VGAM1538 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52831] Chloride Channel 4 (CLCN4, Accession NM\_001830) is a VGAM1538 host target gene. CLCN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN4 BINDING SITE,

designated SEQ ID:7569, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52832] A function of VGAM1538 is therefore inhibition of Chloride Channel 4 (CLCN4, Accession NM\_001830), a gene which is regulation of cell volume; membrane potential stabilization, signal transduction and transepithelial transport. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN4. The function of CLCN4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM558. Hydroxyprostaglandin Dehydrogenase 15-(NAD) (HPGD, Accession NM\_000860) is another VGAM1538 host target gene. HPGD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPGD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPGD BINDING SITE, designated SEQ ID:6522, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4249.

[52833] Another function of VGAM1538 is therefore inhibition of Hydroxyprostaglandin Dehydrogenase 15-(NAD) (HPGD, Accession NM\_000860), a gene which converts cortisol to cortisone. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPGD. The function of HPGD has been established by previous studies. Prostaglandins are involved in many physiologic and cellular processes, such as inflammation. Pichaud et al. (1997) noted that the NAD(+)-dependent 15-hydroxyprostaglandin dehydrogenase (15-PGDH, type I) is the main enzyme of prostaglandin degradation. By catalyzing the conversion of the 15-hydroxyl group of prostaglandins into a keto group, this ubiquitous enzyme strongly reduces the biologic activity of these molecules. The nucleotide sequence coding for PGDH1 was established by Ensor et al. (1990) who found a 801-bp open reading frame coding for a protein with 266 amino acids identical to the amino acid sequence established by Krook et al. (1990). Cortisol reduces the activity of PGDH in human placental cells. 11-beta hydroxysteroid dehydrogenase type II (HSD11B2; 218030) converts cortisol to cortisone. Schoof et al.

(2001) investigated a possible correlation between HSD11B2 and PGDH gene expression in the placenta of patients with preeclampsia. They concluded that, in preeclampsia, HSD11B2 mRNA expression is reduced, leading to a decrease of HSD11B2 activity. Furthermore, by means of an autocrine or paracrine mechanism, the diminished conversion of placental cortisol may lead to reduced PGDH mRNA expression. Animal model experiments lend further support to the function of HPGD. Coggins et al. (2002) generated mice deficient in *Pgdh* by targeted disruption. The *Pgdh*  $-/-$  pups died between 12 and 48 hours of life because of patent ductus arteriosus leading to congestive heart failure. Treatment with indomethacin rescued the phenotype. Coggins et al. (2002) concluded that alterations in PGE<sub>2</sub> metabolism by PGDH during the perinatal period is essential for the permanent closure of the ductus arteriosus.

[52834] It is appreciated that the abovementioned animal model for HPGD is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[52835] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[52836] Schoof, E.; Girstl, M.; Frobenius, W.; Kirschbaum, M.; Dorr, H. G.; Rascher, W.; Dotsch, J. : Decreased gene expression of 11-beta-hydroxysteroid dehydrogenase type 2 and 15-hydroxyprostaglandin dehydrogenase in human placenta of patients with preeclampsia. J. Clin. Endocr. Metab. 86: 1313-1317, 2001. ; and

[52837] Pichaud, F.; Delage-Mourroux, R.; Pidoux, E.; Jullienne, A.; Rousseau-Merck, M.-F. : Chromosomal localization of the type-I 15-PGDH gene to 4q34-q35. Hum. Genet. 99: 279-281, 1997.

[52838] Further studies establishing the function and utilities of HPGD are found in John Hopkins OMIM database record ID 601688, and in cited publications numbered 6229-623 and 2793 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Timeless Homolog (Drosophila) (TIMELESS, Accession NM\_003920) is another VGAM1538 host target gene. TIMELESS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMELESS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

TIMELESS BINDING SITE, designated SEQ ID:10006, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52839] Another function of VGAM1538 is therefore inhibition of Timeless Homolog (Drosophila) (TIMELESS, Accession NM\_003920), a gene which involves in circadian oscillation autoregulation. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMELESS. The function of TIMELESS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM409. Toll-like Receptor 5 (TLR5, Accession XM\_086576) is another VGAM1538 host target gene. TLR5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TLR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLR5 BINDING SITE, designated SEQ ID:38774, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52840] Another function of VGAM1538 is therefore inhibition of

Toll-like Receptor 5 (TLR5, Accession XM\_086576), a gene which participates in the innate immune response to bacterial flagellins. Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLR5. The function of TLR5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM1126.KIAA1557 (Accession XM\_028289) is another VGAM1538 host target gene. KIAA1557 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1557 BINDING SITE, designated SEQ ID:30641, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52841] Another function of VGAM1538 is therefore inhibition of KIAA1557 (Accession XM\_028289). Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1557. Pleckstrin Homology Domain Containing, Fam-

ily A (phosphoinositide binding specific) Member 3 (PLEKHA3, Accession NM\_019091) is another VGAM1538 host target gene. PLEKHA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLEKHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLEKHA3 BINDING SITE, designated SEQ ID:21167, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52842] Another function of VGAM1538 is therefore inhibition of Pleckstrin Homology Domain Containing, Family A (phosphoinositide binding specific) Member 3 (PLEKHA3, Accession NM\_019091). Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLEKHA3. LOC133022 (Accession XM\_068144) is another VGAM1538 host target gene. LOC133022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC133022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC133022 BINDING SITE, designated SEQ ID:37375, to the nucleotide sequence of VGAM1538 RNA, herein designated VGAM RNA, also designated SEQ ID:4249.

[52843] Another function of VGAM1538 is therefore inhibition of LOC133022 (Accession XM\_068144). Accordingly, utilities of VGAM1538 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133022. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1539 (VGAM1539) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52844] VGAM1539 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1539 was detected is described hereinabove with reference to Figs. 1–8.

[52845] VGAM1539 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[52846] VGAM1539 gene encodes a VGAM1539 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1539 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1539 precursor RNA is designated SEQ ID:1525, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1525 is located at position 60492 relative to the genome of Monkeypox Virus.

[52847] VGAM1539 precursor RNA folds onto itself, forming VGAM1539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52848] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1539 folded precursor RNA into VGAM1539 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1539 RNA is designated SEQ ID:4250, and is provided hereinbelow with reference to the sequence listing part.

[52849] VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1539 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52850] VGAM1539 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1539 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1539 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52851] The complementary binding of VGAM1539 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1539 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1539 host target RNA into VGAM1539 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52852] It is appreciated that VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1539 host target genes. The mRNA of each one of this plurality of VGAM1539 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1539 RNA, herein designated VGAM RNA, and which when bound by VGAM1539 RNA causes inhibition of translation of respective one or more VGAM1539 host target proteins.

[52853] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1539 gene, herein designated VGAM GENE, on one or more VGAM1539 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52854] It is yet further appreciated that a function of VGAM1539 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1539 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1539 correlate with, and may be deduced from, the identity of the host target genes which VGAM1539 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52855] Nucleotide sequences of the VGAM1539 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1539 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1539 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1539 are further described hereinbelow with reference to Table 1.

[52856] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1539 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1539 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52857] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1539 gene, herein designated VGAM is inhibition of expression of VGAM1539 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1539 correlate with, and may be deduced from, the identity of the target genes which VGAM1539 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52858] Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542) is a VGAM1539 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:45216, to the nucleotide sequence of VGAM1539 RNA, herein designated VGAM RNA, also designated SEQ ID:4250.

[52859] A function of VGAM1539 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM\_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM1539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Chromosome 20 Open Reading Frame 43 (C20orf43, Accession XM\_009549) is another VGAM1539 host target gene. C20orf43 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf43, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf43 BINDING SITE, designated SEQ ID:30113, to the nucleotide sequence of VGAM1539 RNA, herein designated VGAM RNA, also designated SEQ ID:4250.

[52860] Another function of VGAM1539 is therefore inhibition of Chromosome 20 Open Reading Frame 43 (C20orf43, Ac-

cession XM\_009549). Accordingly, utilities of VGAM1539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf43.

KIAA1559 (Accession XM\_054472) is another VGAM1539 host target gene. KIAA1559 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1559 BINDING SITE, designated SEQ ID:36160, to the nucleotide sequence of VGAM1539 RNA, herein designated VGAM RNA, also designated SEQ ID:4250.

[52861] Another function of VGAM1539 is therefore inhibition of KIAA1559 (Accession XM\_054472). Accordingly, utilities of VGAM1539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1559. LOC152179 (Accession XM\_098170) is another VGAM1539 host target gene. LOC152179 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC152179 BINDING SITE, designated SEQ ID:41431, to the nucleotide sequence of VGAM1539 RNA, herein designated VGAM RNA, also designated SEQ ID:4250.

[52862] Another function of VGAM1539 is therefore inhibition of LOC152179 (Accession XM\_098170). Accordingly, utilities of VGAM1539 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1540 (VGAM1540) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52863] VGAM1540 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1540 was detected is described hereinabove with reference to Figs. 1–8.

[52864] VGAM1540 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[52865] VGAM1540 gene encodes a VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1540 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1540 precursor RNA is designated SEQ ID:1526, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1526 is located at position 61618 relative to the genome of Monkeypox Virus.

[52866] VGAM1540 precursor RNA folds onto itself, forming VGAM1540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52867] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1540 folded precursor RNA into VGAM1540 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1540 RNA is designated SEQ ID:4251, and is provided hereinbelow with reference to the sequence listing part.

[52868] VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1540 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52869] VGAM1540 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1540 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1540 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52870] The complementary binding of VGAM1540 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1540 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1540 host target RNA into VGAM1540 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52871] It is appreciated that VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1540 host target genes. The mRNA of each one of this plurality of VGAM1540 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1540 RNA, herein designated VGAM RNA, and which when bound by VGAM1540 RNA causes inhibition of translation of respective one or more VGAM1540 host target proteins.

[52872] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1540 gene, herein designated VGAM GENE, on one or more VGAM1540 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52873] It is yet further appreciated that a function of VGAM1540 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1540 correlate with, and may be deduced from, the identity of the host target genes which VGAM1540 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52874] Nucleotide sequences of the VGAM1540 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1540 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1540 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1540 are further described hereinbelow with reference to Table 1.

[52875] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1540 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1540 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52876] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1540 gene, herein designated VGAM is inhibition of expression of VGAM1540 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1540 correlate with, and may be deduced from, the identity of the target genes which VGAM1540 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52877] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649) is a VGAM1540 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7352, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52878] A function of VGAM1540 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082) is another VGAM1540 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5529, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52879] Another function of VGAM1540 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with CKN1. High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is another VGAM1540 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9561, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52880] Another function of VGAM1540 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM\_168302) is another VGAM1540

host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45101, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52881] Another function of VGAM1540 is therefore inhibition of Zinc Finger Protein 36 (KOX 18) (ZNF36, Accession XM\_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804.FLJ23191 (Accession NM\_024574) is another VGAM1540 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23803, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52882] Another function of VGAM1540 is therefore inhibition of FLJ23191 (Accession NM\_024574). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. KIAA0841 (Accession XM\_049237) is another VGAM1540 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35359, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52883] Another function of VGAM1540 is therefore inhibition of KIAA0841 (Accession XM\_049237). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0841. Ring Finger Protein 20 (RNF20, Accession NM\_019592) is another VGAM1540 host target gene. RNF20 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF20 BINDING SITE, designated SEQ ID:21213, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52884] Another function of VGAM1540 is therefore inhibition of Ring Finger Protein 20 (RNF20, Accession NM\_019592). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF20. LOC118851 (Accession XM\_061180) is another VGAM1540 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, desig-

nated SEQ ID:37199, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52885] Another function of VGAM1540 is therefore inhibition of LOC118851 (Accession XM\_061180). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC150005 (Accession XM\_097795) is another VGAM1540 host target gene. LOC150005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:41122, to the nucleotide sequence of VGAM1540 RNA, herein designated VGAM RNA, also designated SEQ ID:4251.

[52886] Another function of VGAM1540 is therefore inhibition of LOC150005 (Accession XM\_097795). Accordingly, utilities of VGAM1540 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1541 (VGAM1541) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52887] VGAM1541 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1541 was detected is described hereinabove with reference to Figs. 1–8.

[52888] VGAM1541 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Monkeypox Virus. VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52889] VGAM1541 gene encodes a VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1541 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1541 precursor RNA is designated SEQ ID:1527, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1527 is located at position 63264 relative to the

genome of Monkeypox Virus.

[52890] VGAM1541 precursor RNA folds onto itself, forming VGAM1541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52891] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1541 folded precursor RNA into VGAM1541 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1541 RNA is designated SEQ ID:4252, and is provided hereinbelow with reference to the sequence listing part.

[52892] VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1541 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52893] VGAM1541 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1541 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1541 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[52894] The complementary binding of VGAM1541 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1541 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1541 host target RNA into VGAM1541 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52895] It is appreciated that VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1541 host target genes. The mRNA of each one of this plurality of VGAM1541 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1541 RNA, herein designated VGAM RNA, and which when bound by VGAM1541 RNA causes inhibition of translation of respective one or more VGAM1541 host target proteins.

[52896] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1541 gene, herein designated VGAM GENE, on one or more VGAM1541 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52897] It is yet further appreciated that a function of VGAM1541 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of viral infection by Monkeypox Virus. Specific functions, and accordingly utilities, of VGAM1541 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1541 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52898] Nucleotide sequences of the VGAM1541 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1541 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1541 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1541 are further described hereinbelow with reference to Table 1.

[52899] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1541 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1541 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52900] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1541 gene, herein designated VGAM is inhibition of expression of VGAM1541 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1541 correlate with, and may be deduced

from, the identity of the target genes which VGAM1541 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52901] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089) is a VGAM1541 host target gene. ABCB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB10 BINDING SITE, designated SEQ ID:14374, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52902] A function of VGAM1541 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089), a gene which a member of the superfamily of ATP-binding cassette (ABC) transporters. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB10. The function of ABCB10 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM1523. Adducin 1 (alpha) (ADD1, Accession NM\_014190) is another VGAM1541 host target gene. ADD1 BINDING SITE1 and ADD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE1 and ADD1 BINDING SITE2, designated SEQ ID:15474 and SEQ ID:15470 respectively, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52903] Another function of VGAM1541 is therefore inhibition of Adducin 1 (alpha) (ADD1, Accession NM\_014190), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD1. The function of ADD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. Chemokine (C-C motif) Receptor 9

(CCR9, Accession NM\_006641) is another VGAM1541 host target gene. CCR9 BINDING SITE1 and CCR9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR9 BINDING SITE1 and CCR9 BINDING SITE2, designated SEQ ID:13432 and SEQ ID:22412 respectively, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52904] Another function of VGAM1541 is therefore inhibition of Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM\_006641), a gene which binds beta-chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9. The function of CCR9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1324.CGTHBA (Accession NM\_012075) is another VGAM1541 host target gene. CGTHBA BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14364, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52905] Another function of VGAM1541 is therefore inhibition of CGTHBA (Accession NM\_012075). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGTHBA. Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is another VGAM1541 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42721, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52906] Another function of VGAM1541 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440) is another VGAM1541 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7171, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52907] Another function of VGAM1541 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440), a gene which is a member of the multiple ex-

ostoses gene family. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Growth Hormone Receptor (GHR, Accession NM\_000163) is another VGAM1541 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5671, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52908] Another function of VGAM1541 is therefore inhibition of Growth Hormone Receptor (GHR, Accession NM\_000163). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM1541 host target gene. HS2ST1 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14576, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52909] Another function of VGAM1541 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS2ST1. Nucleobindin 1 (NUCB1, Accession NM\_006184) is another VGAM1541 host target gene. NUCB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NUCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCB1 BINDING SITE, designated SEQ ID:12851, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52910] Another function of VGAM1541 is therefore inhibition of Nucleobindin 1 (NUCB1, Accession NM\_006184), a gene which may have a role in calcium homeostasis. Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUCB1. The function of NUCB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523. CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM\_006035) is another VGAM1541 host target gene. CDC42BPB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDC42BPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42BPB BINDING SITE, designated SEQ ID:12658, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52911] Another function of VGAM1541 is therefore inhibition of CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM\_006035). Accordingly, utilities

of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42BPB. DKFZP566B183 (Accession NM\_015509) is another VGAM1541 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ ID:17769, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52912] Another function of VGAM1541 is therefore inhibition of DKFZP566B183 (Accession NM\_015509). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. DKFZP566I1024 (Accession XM\_046506) is another VGAM1541 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:34735, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52913] Another function of VGAM1541 is therefore inhibition of DKFZP566I1024 (Accession XM\_046506). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. DKFZp761B0514 (Accession NM\_032289) is another VGAM1541 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26053, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52914] Another function of VGAM1541 is therefore inhibition of DKFZp761B0514 (Accession NM\_032289). Accordingly, utilities of VGAM1541 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZp761B0514. FLJ13305 (Accession XM\_117270) is another VGAM1541 host target gene. FLJ13305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13305 BINDING SITE, designated SEQ ID:43345, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52915] Another function of VGAM1541 is therefore inhibition of FLJ13305 (Accession XM\_117270). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13305. KIAA0265 (Accession XM\_045954) is another VGAM1541 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34620, to the

nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52916] Another function of VGAM1541 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA1117 (Accession XM\_028219) is another VGAM1541 host target gene. KIAA1117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1117 BINDING SITE, designated SEQ ID:30632, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52917] Another function of VGAM1541 is therefore inhibition of KIAA1117 (Accession XM\_028219). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1117. KIAA1319 (Accession NM\_020770) is another VGAM1541 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21870, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52918] Another function of VGAM1541 is therefore inhibition of KIAA1319 (Accession NM\_020770). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512) is another VGAM1541 host target gene. NUDT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT13 BINDING SITE, designated SEQ ID:31664, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52919] Another function of VGAM1541 is therefore inhibition of

Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT13. SSH2 (Accession XM\_030846) is another VGAM1541 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31176, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52920] Another function of VGAM1541 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144) is another VGAM1541 host target gene. SSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9113, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52921] Another function of VGAM1541 is therefore inhibition of Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR1. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM1541 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18072, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52922] Another function of VGAM1541 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. LOC115294 (Accession XM\_054302) is another VGAM1541 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36145, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52923] Another function of VGAM1541 is therefore inhibition of LOC115294 (Accession XM\_054302). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC150271 (Accession XM\_097859) is another VGAM1541 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41166, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52924] Another function of VGAM1541 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC151877 (Accession XM\_098132) is another VGAM1541 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41398, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52925] Another function of VGAM1541 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities

of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC152300 (Accession XM\_087432) is another VGAM1541 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39248, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52926] Another function of VGAM1541 is therefore inhibition of LOC152300 (Accession XM\_087432). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC154084 (Accession XM\_098468) is another VGAM1541 host target gene. LOC154084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154084 BINDING SITE, designated SEQ ID:41685, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52927] Another function of VGAM1541 is therefore inhibition of LOC154084 (Accession XM\_098468). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154084. LOC158402 (Accession XM\_098936) is another VGAM1541 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41976, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52928] Another function of VGAM1541 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC162333 (Accession XM\_102591) is another VGAM1541 host target gene. LOC162333 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42124, to the nucleotide sequence of VGAM1541 RNA, herein designated VGAM RNA, also designated SEQ ID:4252.

[52929] Another function of VGAM1541 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1541 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1542 (VGAM1542) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52930] VGAM1542 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1542 was detected is described hereinabove with reference to Figs. 1-8.

[52931] VGAM1542 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52932] VGAM1542 gene encodes a VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1542 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1542 precursor RNA is designated SEQ ID:1528, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1528 is located at position 56199 relative to the genome of Variola Virus.

[52933] VGAM1542 precursor RNA folds onto itself, forming VGAM1542 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[52934] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1542 folded precursor RNA into VGAM1542 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1542 RNA is designated SEQ ID:4253, and is provided hereinbelow with reference to the sequence listing part.

[52935] VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1542 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52936] VGAM1542 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1542 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1542 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1542 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52937] The complementary binding of VGAM1542 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1542 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1542 host target RNA into VGAM1542 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[52938] It is appreciated that VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1542 host target genes. The mRNA of each one of this plurality of VGAM1542 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1542 RNA, herein designated VGAM RNA, and which when bound by VGAM1542 RNA causes inhibition of translation of respective one or more VGAM1542 host target proteins.

[52939] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1542 gene, herein designated VGAM GENE, on one or more VGAM1542 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52940] It is yet further appreciated that a function of VGAM1542 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1542 correlate with, and may be deduced from, the identity of the host target genes which VGAM1542 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52941] Nucleotide sequences of the VGAM1542 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1542 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1542 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1542 are further described hereinbelow with reference to Table 1.

[52942] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1542 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1542 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52943] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1542 gene, herein designated VGAM is inhibition of expression of VGAM1542 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1542 correlate with, and may be deduced from, the identity of the target genes which VGAM1542 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52944] LOC147057 (Accession XM\_097166) is a VGAM1542 host target gene. LOC147057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC147057 BINDING SITE, designated SEQ ID:40782, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52945] A function of VGAM1542 is therefore inhibition of LOC147057 (Accession XM\_097166). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147057. LOC154739 (Accession XM\_098602) is another VGAM1542 host target gene. LOC154739 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41716, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52946] Another function of VGAM1542 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC203276 (Accession XM\_117523) is an-

other VGAM1542 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43483, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52947] Another function of VGAM1542 is therefore inhibition of LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM1542 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43507, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52948] Another function of VGAM1542 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM\_173233) is another VGAM1542 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46509, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52949] Another function of VGAM1542 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC90038 (Accession XM\_028305) is another VGAM1542 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30646, to the nucleotide sequence of VGAM1542 RNA, herein designated VGAM RNA, also designated SEQ ID:4253.

[52950] Another function of VGAM1542 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM1542 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1543 (VGAM1543) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52951] VGAM1543 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1543 was detected is described hereinabove with reference to Figs. 1–8.

[52952] VGAM1543 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1543 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[52953] VGAM1543 gene encodes a VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1543 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1543 precursor RNA is designated SEQ ID:1529, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1529 is located at position 66348 relative to the genome of Vaccinia Virus.

[52954] VGAM1543 precursor RNA folds onto itself, forming VGAM1543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[52955] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1543 folded precursor RNA into VGAM1543

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM1543 RNA is designated SEQ ID:4254, and is provided hereinbelow with reference to the sequence listing part.

[52956] VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1543 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[52957] VGAM1543 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1543 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1543 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[52958] The complementary binding of VGAM1543 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1543 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1543 host target RNA into VGAM1543 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[52959] It is appreciated that VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1543 host target genes. The mRNA of each one of this plurality of VGAM1543 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1543 RNA, herein designated VGAM RNA, and which when bound by VGAM1543 RNA causes inhibition of translation of respective one or more VGAM1543 host target proteins.

[52960] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1543 gene, herein designated VGAM GENE, on one or more VGAM1543 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[52961] It is yet further appreciated that a function of VGAM1543 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1543 correlate with, and may be deduced from, the identity of the host target genes which VGAM1543 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[52962] Nucleotide sequences of the VGAM1543 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1543 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1543 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1543 are further described hereinbelow with reference to Table 1.

[52963] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1543 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1543 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[52964] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1543 gene, herein designated VGAM is inhibition of expression of VGAM1543 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1543 correlate with, and may be deduced from, the identity of the target genes which VGAM1543 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[52965] ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089) is a VGAM1543 host target gene. ABCB10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCB10 BINDING SITE, designated SEQ ID:14374, to the nucleotide sequence of

VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52966] A function of VGAM1543 is therefore inhibition of ATP-binding Cassette, Sub-family B (MDR/TAP), Member 10 (ABCB10, Accession NM\_012089), a gene which a member of the superfamily of ATP-binding cassette (ABC) transporters. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCB10. The function of ABCB10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523. Adducin 1 (alpha) (ADD1, Accession NM\_014189) is another VGAM1543 host target gene. ADD1 BINDING SITE1 and ADD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADD1 BINDING SITE1 and ADD1 BINDING SITE2, designated SEQ ID:15470 and SEQ ID:15474 respectively, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4254.

[52967] Another function of VGAM1543 is therefore inhibition of Adducin 1 (alpha) (ADD1, Accession NM\_014189), a gene which membrane-cytoskeleton- protein that promotes the assembly of the spectrin-actin network. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADD1. The function of ADD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM474. Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM\_031200) is another VGAM1543 host target gene. CCR9 BINDING SITE1 and CCR9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CCR9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR9 BINDING SITE1 and CCR9 BINDING SITE2, designated SEQ ID:25249 and SEQ ID:22412 respectively, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52968] Another function of VGAM1543 is therefore inhibition of

Chemokine (C-C motif) Receptor 9 (CCR9, Accession NM\_031200), a gene which binds beta-chemokine family and subsequently transduces a signal by increasing the intracellular calcium ions level. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR9. The function of CCR9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1324.CGTHBA (Accession NM\_012075) is another VGAM1543 host target gene. CGTHBA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CGTHBA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGTHBA BINDING SITE, designated SEQ ID:14364, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52969] Another function of VGAM1543 is therefore inhibition of CGTHBA (Accession NM\_012075). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

CGTHBA. Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is another VGAM1543 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42721, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52970] Another function of VGAM1543 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440) is another VGAM1543 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7171, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52971] Another function of VGAM1543 is therefore inhibition of Exostoses (multiple)-like 3 (EXTL3, Accession NM\_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Growth Hormone Receptor (GHR, Accession NM\_000163) is another VGAM1543 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5671, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52972] Another function of VGAM1543 is therefore inhibition of Growth Hormone Receptor (GHR, Accession NM\_000163). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262) is another VGAM1543 host target gene. HS2ST1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS2ST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS2ST1 BINDING SITE, designated SEQ ID:14576, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52973] Another function of VGAM1543 is therefore inhibition of Heparan Sulfate 2-O-sulfotransferase 1 (HS2ST1, Accession NM\_012262). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with HS2ST1. Nucleobindin 1 (NUCB1, Accession NM\_006184) is another VGAM1543 host target gene. NUCB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUCB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCB1 BINDING SITE, designated SEQ ID:12851, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52974] Another function of VGAM1543 is therefore inhibition of Nucleobindin 1 (NUCB1, Accession NM\_006184), a gene which may have a role in calcium homeostasis. Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUCB1. The function of NUCB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1523. CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM\_006035) is another VGAM1543 host target gene. CDC42BPB BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by CDC42BPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC42BPB BINDING SITE, designated SEQ ID:12658, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52975] Another function of VGAM1543 is therefore inhibition of CDC42 Binding Protein Kinase Beta (DMPK-like) (CDC42BPB, Accession NM\_006035). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC42BPB. DKFZP566B183 (Accession NM\_015509) is another VGAM1543 host target gene. DKFZP566B183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566B183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566B183 BINDING SITE, designated SEQ ID:17769, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ

ID:4254.

[52976] Another function of VGAM1543 is therefore inhibition of DKFZP566B183 (Accession NM\_015509). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566B183. DKFZP566I1024 (Accession XM\_046506) is another VGAM1543 host target gene. DKFZP566I1024 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566I1024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566I1024 BINDING SITE, designated SEQ ID:34735, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52977] Another function of VGAM1543 is therefore inhibition of DKFZP566I1024 (Accession XM\_046506). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566I1024. DKFZp761B0514 (Accession NM\_032289) is another VGAM1543 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26053, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52978] Another function of VGAM1543 is therefore inhibition of DKFZp761B0514 (Accession NM\_032289). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. FLJ13305 (Accession XM\_117270) is another VGAM1543 host target gene. FLJ13305 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13305 BINDING SITE, designated SEQ ID:43345, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52979] Another function of VGAM1543 is therefore inhibition of

FLJ13305 (Accession XM\_117270). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13305. KIAA0265 (Accession XM\_045954) is another VGAM1543 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34620, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52980] Another function of VGAM1543 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA1117 (Accession XM\_028219) is another VGAM1543 host target gene. KIAA1117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1117 BINDING SITE, designated SEQ ID:30632, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52981] Another function of VGAM1543 is therefore inhibition of KIAA1117 (Accession XM\_028219). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1117. KIAA1319 (Accession NM\_020770) is another VGAM1543 host target gene. KIAA1319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1319 BINDING SITE, designated SEQ ID:21870, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52982] Another function of VGAM1543 is therefore inhibition of KIAA1319 (Accession NM\_020770). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1319. Nudix (nucleoside diphosphate linked moiety

X)-type Motif 13 (NUDT13, Accession XM\_032512) is another VGAM1543 host target gene. NUDT13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT13 BINDING SITE, designated SEQ ID:31664, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52983] Another function of VGAM1543 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 13 (NUDT13, Accession XM\_032512). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT13. SSH2 (Accession XM\_030846) is another VGAM1543 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31176, to the nucleotide sequence of

VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52984] Another function of VGAM1543 is therefore inhibition of SSH2 (Accession XM\_030846). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144) is another VGAM1543 host target gene. SSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9113, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52985] Another function of VGAM1543 is therefore inhibition of Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR1. TAF9-like RNA Polymerase II, TATA Box Bind-

ing Protein (TBP)–associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM1543 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18072, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52986] Another function of VGAM1543 is therefore inhibition of TAF9–like RNA Polymerase II, TATA Box Binding Protein (TBP)–associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. LOC115294 (Accession XM\_054302) is another VGAM1543 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu–

cleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36145, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52987] Another function of VGAM1543 is therefore inhibition of LOC115294 (Accession XM\_054302). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC150271 (Accession XM\_097859) is another VGAM1543 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41166, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52988] Another function of VGAM1543 is therefore inhibition of LOC150271 (Accession XM\_097859). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC151877 (Accession XM\_098132) is an-

other VGAM1543 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41398, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52989] Another function of VGAM1543 is therefore inhibition of LOC151877 (Accession XM\_098132). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC152300 (Accession XM\_087432) is another VGAM1543 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39248, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52990] Another function of VGAM1543 is therefore inhibition of LOC152300 (Accession XM\_087432). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC154084 (Accession XM\_098468) is another VGAM1543 host target gene. LOC154084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154084 BINDING SITE, designated SEQ ID:41685, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52991] Another function of VGAM1543 is therefore inhibition of LOC154084 (Accession XM\_098468). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154084. LOC158402 (Accession XM\_098936) is another VGAM1543 host target gene. LOC158402 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158402, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158402 BINDING SITE, designated SEQ ID:41976, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52992] Another function of VGAM1543 is therefore inhibition of LOC158402 (Accession XM\_098936). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158402. LOC162333 (Accession XM\_102591) is another VGAM1543 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42124, to the nucleotide sequence of VGAM1543 RNA, herein designated VGAM RNA, also designated SEQ ID:4254.

[52993] Another function of VGAM1543 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1543 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC162333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1544 (VGAM1544) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[52994] VGAM1544 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1544 was detected is described hereinabove with reference to Figs. 1–8.

[52995] VGAM1544 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[52996] VGAM1544 gene encodes a VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1544 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1544 precursor RNA is designated SEQ ID:1530, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1530 is located at position 50463 relative to the genome of Variola Virus.

- [52997] VGAM1544 precursor RNA folds onto itself, forming VGAM1544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [52998] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1544 folded precursor RNA into VGAM1544 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM1544 RNA is designated SEQ ID:4255, and is provided hereinbelow with reference to the sequence listing part.

[52999] VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1544 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53000] VGAM1544 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1544 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1544 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53001] The complementary binding of VGAM1544 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1544 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1544 host target RNA into VGAM1544 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53002] It is appreciated that VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1544 host target genes. The mRNA of each one of this plurality of VGAM1544 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1544 RNA, herein designated VGAM RNA, and which when bound by VGAM1544 RNA causes

inhibition of translation of respective one or more VGAM1544 host target proteins.

[53003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1544 gene, herein designated VGAM GENE, on one or more VGAM1544 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53004] It is yet further appreciated that a function of VGAM1544 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1544 correlate with, and may be deduced from, the identity of the host target genes which VGAM1544 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53005] Nucleotide sequences of the VGAM1544 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1544 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1544 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1544 are further described hereinbelow with reference to Table 1.

[53006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1544 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1544 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[53007] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1544 gene, herein designated VGAM is inhibition of expression of VGAM1544 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1544 correlate with, and may be deduced from, the identity of the target genes which VGAM1544 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53008] ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM\_001089) is a VGAM1544 host target gene. ABCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA3 BINDING SITE, designated SEQ ID:6743, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53009] A function of VGAM1544 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 3 (ABCA3, Accession NM\_001089), a gene which may be a trans-

porter, may act as an efflux pump for chemotherapeutics drugs. Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA3. The function of ABCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM336. Cathepsin B (CTSB, Accession XM\_035662) is another VGAM1544 host target gene. CTSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSB BINDING SITE, designated SEQ ID:32328, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53010] Another function of VGAM1544 is therefore inhibition of Cathepsin B (CTSB, Accession XM\_035662). Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSB. Oxytocin Receptor (OXTR, Accession NM\_000916) is another VGAM1544 host target gene.

OXTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OXTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OXTR BINDING SITE, designated SEQ ID:6622, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53011] Another function of VGAM1544 is therefore inhibition of Oxytocin Receptor (OXTR, Accession NM\_000916), a gene which induces inward ion currents. Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OXTR. The function of OXTR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM636. Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM\_006252) is another VGAM1544 host target gene. PRKAA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PRKAA2 BINDING SITE, designated SEQ ID:12928, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53012] Another function of VGAM1544 is therefore inhibition of Protein Kinase, AMP-activated, Alpha 2 Catalytic Subunit (PRKAA2, Accession NM\_006252), a gene which are responsible for the regulation of fatty acid synthesis by phosphorylation of acetyl-coa carboxylase. Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAA2. The function of PRKAA2 has been established by previous studies. AMP-activated protein kinase plays a key role in the regulation of fatty acid and cholesterol metabolism (Hardie, 1992; Hardie and MacKintosh, 1992). In vitro, it phosphorylates and inactivates 3-hydroxy-3-methylglutaryl-CoA reductase (HMGCR; 142910) and acetyl-CoA carboxylase (ACC; 200350), key enzymes involved in regulating de novo biosynthesis of cholesterol and fatty acids, respectively. See PRKAA1 (OMIM Ref. No. 602739) for additional background. Beri et al. (1994) used a cDNA encoding rat liver AMPK to isolate human skeletal muscle AMPK cDNA clones. The human

cDNA was more than 90% homologous to the rat sequence and predicted a protein of 62.3 kD that closely agreed with the mass of human AMPK observed in Western blots of human tissue extracts. A cDNA probe was used to identify a 9.5-kb transcript in several human tissues and to isolate human genomic clones. Stapleton et al. (1997) showed that rat liver Ampk-alpha-2 is associated with Ampk-beta-1 (PRKAB1; 602740) and Ampk-gamma-1 (PRKAG1; 602742). They noted that Ampk-alpha-1 (OMIM Ref. No. PRKAA1) is also associated with these beta and gamma isoforms. Beri et al. (1994) used PCR mapping of rodent/human hybrid cell lines to localize the human AMPK gene to chromosome 1, and they sublocalized the AMPK gene to 1p31 by fluorescence in situ hybridization with a human genomic clone. (The cDNA referred to as AMPK by Beri et al. (1994) encodes the alpha-2 subunit of AMPK.) Tsujikawa et al. (1998) determined that PRKAA2 and the CDC-like kinase-2 gene (CLK2; 602989) are located in the same interval of approximately 2.6 cM between D1S2890 and D1S2801. They suggested that CLK2 and PRKAA2 are possible candidate genes for gelatinous drop-like corneal dystrophy (OMIM Ref. No. 204870). Mu et al. (2001) investigated the role of the metabolic sensor

AMPK in the regulation of glucose transport in skeletal muscle. Expression in mouse muscle of a dominant inhibitory mutant of Ampk- $\alpha$ -2 completely blocked the ability of hypoxia and 5-aminoimidazole-4-carboxamide ribonucleoside (AICAR) to activate hexose uptake, while only partially reducing contraction-stimulated hexose uptake. These data indicated that AMPK transmits a portion of the signal by which muscle contraction increases glucose uptake, but other AMPK-independent pathways also contribute to the response. Minokoshi et al. (2002) demonstrated that leptin (OMIM Ref. No. 164160) selectively stimulates phosphorylation and activation of AMPK- $\alpha$ -2 in skeletal muscle, thus establishing an additional signaling pathway for leptin. Early activation of AMPK occurs by leptin acting directly on muscle, whereas later activation depends on leptin functioning through the hypothalamic-sympathetic nervous system axis. In parallel with its activation of AMPK, leptin suppresses the activity of ACC (200350, 601557), thereby stimulating the oxidation of fatty acids in muscle. Blocking AMPK activation inhibits the phosphorylation of ACC stimulated by leptin. Minokoshi et al. (2002) concluded that their data identify AMPK as a principal mediator of the effects of leptin on

fatty acid metabolism in muscle.

[53013] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53014] Minokoshi, Y.; Kim, Y.-B.; Peroni, O. D.; Fryer, L. G. D.; Muller, C.; Carling, D.; Kahn, B. B. : Leptin stimulates fatty-acid oxidation by activating AMP-activated protein kinase. Nature 415: 339-343, 2002. ; and

[53015] Mu, J.; Brozinick, J. T., Jr.; Valladares, O.; Bucan, M.; Birnbaum, M. J. : A role for AMP-activated protein kinase in contraction- and hypoxia-regulated glucose transport in skeletal m.

[53016] Further studies establishing the function and utilities of PRKAA2 are found in John Hopkins OMIM database record ID 600497, and in cited publications numbered 10692-10694, 10329, 10695-1069 and 1355 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0970 (Accession NM\_014923) is another VGAM1544 host target gene. KIAA0970 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0970, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0970 BINDING SITE, designated SEQ ID:17202, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53017] Another function of VGAM1544 is therefore inhibition of KIAA0970 (Accession NM\_014923). Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0970. LOC91694 (Accession XM\_040082) is another VGAM1544 host target gene. LOC91694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91694 BINDING SITE, designated SEQ ID:33249, to the nucleotide sequence of VGAM1544 RNA, herein designated VGAM RNA, also designated SEQ ID:4255.

[53018] Another function of VGAM1544 is therefore inhibition of LOC91694 (Accession XM\_040082). Accordingly, utilities of VGAM1544 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91694. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1545 (VGAM1545) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53019] VGAM1545 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1545 was detected is described hereinabove with reference to Figs. 1–8.

[53020] VGAM1545 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus. VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53021] VGAM1545 gene encodes a VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1545 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1545 precursor RNA is designated SEQ ID:1531, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1531 is located at position 53558 relative to the genome of Variola Virus.

- [53022] VGAM1545 precursor RNA folds onto itself, forming VGAM1545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53023] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1545 folded precursor RNA into VGAM1545 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1545 RNA is designated SEQ ID:4256, and is provided hereinbelow with reference to the sequence listing part.

[53024] VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1545 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53025] VGAM1545 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1545 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1545 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[53026] The complementary binding of VGAM1545 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1545 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1545 host target RNA into VGAM1545 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53027] It is appreciated that VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1545 host target genes. The mRNA of each one of this plurality of VGAM1545 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1545 RNA, herein designated VGAM RNA, and which when bound by VGAM1545 RNA causes

inhibition of translation of respective one or more VGAM1545 host target proteins.

[53028] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1545 gene, herein designated VGAM GENE, on one or more VGAM1545 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53029] It is yet further appreciated that a function of VGAM1545 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1545 include diagnosis, prevention and

treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1545 correlate with, and may be deduced from, the identity of the host target genes which VGAM1545 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53030] Nucleotide sequences of the VGAM1545 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1545 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1545 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1545 are further described hereinbelow with reference to Table 1.

[53031] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1545 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1545 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53032] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1545 gene, herein designated VGAM is inhibition of expression of VGAM1545 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1545 correlate with, and may be deduced from, the identity of the target genes which VGAM1545 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53033] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252) is a VGAM1545 host target gene. CLECSF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLECSF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF5 BINDING SITE, designated SEQ ID:14918, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53034] A function of VGAM1545 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 5 (CLECSF5, Accession NM\_013252). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLECSF5. Early Growth Re-

sponse 3 (EGR3, Accession XM\_005040) is another VGAM1545 host target gene. EGR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR3 BINDING SITE, designated SEQ ID:29956, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53035] Another function of VGAM1545 is therefore inhibition of Early Growth Response 3 (EGR3, Accession XM\_005040), a gene which is a putative transcription factor. Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR3. The function of EGR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM189. Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731) is another VGAM1545 host target gene. FCMD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FCMD, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCMD BINDING SITE, designated SEQ ID:13577, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53036] Another function of VGAM1545 is therefore inhibition of Fukuyama Type Congenital Muscular Dystrophy (fukutin) (FCMD, Accession NM\_006731). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCMD. Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM\_000176) is another VGAM1545 host target gene. NR3C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C1 BINDING SITE, designated SEQ ID:5686, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53037] Another function of VGAM1545 is therefore inhibition of

Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM\_000176). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C1. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession NM\_003071) is another VGAM1545 host target gene. SMARCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCA3 BINDING SITE, designated SEQ ID:9037, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53038] Another function of VGAM1545 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily A, Member 3 (SMARCA3, Accession NM\_003071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with SMARCA3. The function of SMARCA3 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1330. Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809) is another VGAM1545 host target gene. C12orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C12orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C12orf22 BINDING SITE, designated SEQ ID:25125, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53039] Another function of VGAM1545 is therefore inhibition of Chromosome 12 Open Reading Frame 22 (C12orf22, Accession NM\_030809). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C12orf22. FLJ10687 (Accession NM\_018178) is another VGAM1545 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20009, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53040] Another function of VGAM1545 is therefore inhibition of FLJ10687 (Accession NM\_018178). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ21140 (Accession NM\_024776) is another VGAM1545 host target gene. FLJ21140 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21140 BINDING SITE, designated SEQ ID:24143, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53041] Another function of VGAM1545 is therefore inhibition of FLJ21140 (Accession NM\_024776). Accordingly, utilities of

VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21140. KIAA0872 (Accession NM\_014940) is another VGAM1545 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17247, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53042] Another function of VGAM1545 is therefore inhibition of KIAA0872 (Accession NM\_014940). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. KIAA1211 (Accession XM\_044178) is another VGAM1545 host target gene. KIAA1211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1211 BINDING SITE, designated SEQ ID:34161, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53043] Another function of VGAM1545 is therefore inhibition of KIAA1211 (Accession XM\_044178). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1211. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM\_015361) is another VGAM1545 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17663, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53044] Another function of VGAM1545 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM\_015361). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with R3HDM. LOC148946 (Accession XM\_097557) is another VGAM1545 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40941, to the nucleotide sequence of VGAM1545 RNA, herein designated VGAM RNA, also designated SEQ ID:4256.

[53045] Another function of VGAM1545 is therefore inhibition of LOC148946 (Accession XM\_097557). Accordingly, utilities of VGAM1545 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1546 (VGAM1546) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53046] VGAM1546 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1546 was detected is described hereinabove with reference to Figs. 1–8.

[53047] VGAM1546 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Variola Virus.

VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53048] VGAM1546 gene encodes a VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1546 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1546 precursor RNA is designated SEQ ID:1532, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1532 is located at position 51253 relative to the genome of Variola Virus.

[53049] VGAM1546 precursor RNA folds onto itself, forming VGAM1546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53050] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1546 folded precursor RNA into VGAM1546 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1546 RNA is designated SEQ ID:4257, and is provided hereinbelow with reference to the sequence listing part.

[53051] VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1546 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53052] VGAM1546 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1546 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1546 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[53053] The complementary binding of VGAM1546 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1546 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1546 host target RNA into VGAM1546 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53054] It is appreciated that VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1546 host target genes. The mRNA of each one of this plurality of VGAM1546 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1546 RNA, herein designated VGAM RNA, and which when bound by VGAM1546 RNA causes inhibition of translation of respective one or more VGAM1546 host target proteins.

[53055] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1546 gene, herein designated VGAM GENE, on one or more VGAM1546 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53056] It is yet further appreciated that a function of VGAM1546 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of viral infection by Variola Virus. Specific functions, and accordingly utilities, of VGAM1546 correlate with, and may be deduced from, the identity of the host target genes which VGAM1546 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53057] Nucleotide sequences of the VGAM1546 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1546 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1546 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1546 are further described hereinbelow with reference to Table 1.

[53058] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1546 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1546 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53059] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1546 gene, herein designated VGAM is inhibition of expression of VGAM1546 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1546 correlate with, and may be deduced from, the identity of the target genes which VGAM1546 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53060] Caveolin 3 (CAV3, Accession NM\_033337) is a VGAM1546 host target gene. CAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAV3, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAV3 BINDING SITE, designated SEQ ID:27190, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53061] A function of VGAM1546 is therefore inhibition of Caveolin 3 (CAV3, Accession NM\_033337). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV3. CD1D Antigen, D Polypeptide (CD1D, Accession XM\_086610) is another VGAM1546 host target gene. CD1D BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CD1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD1D BINDING SITE, designated SEQ ID:38789, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53062] Another function of VGAM1546 is therefore inhibition of CD1D Antigen, D Polypeptide (CD1D, Accession XM\_086610), a gene which is a member D of the CD1

family; involved in antigen presentation . Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD1D. The function of CD1D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1107. COX10 Homolog, Cytochrome C Oxidase Assembly Protein, Heme A: Farnesyltransferase (yeast) (COX10, Accession NM\_001303) is another VGAM1546 host target gene. COX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX10 BINDING SITE, designated SEQ ID:6979, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53063] Another function of VGAM1546 is therefore inhibition of COX10 Homolog, Cytochrome C Oxidase Assembly Protein, Heme A: Farnesyltransferase (yeast) (COX10, Accession NM\_001303). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with COX10. Jerky Homolog-like (mouse) (JRKL, Accession NM\_003772) is another VGAM1546 host target gene. JRKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JRKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JRKL BINDING SITE, designated SEQ ID:9854, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53064] Another function of VGAM1546 is therefore inhibition of Jerky Homolog-like (mouse) (JRKL, Accession NM\_003772), a gene which is a Jerky-related protein and similar to centromere binding protein-B and other nuclear regulators. Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JRKL. The function of JRKL has been established by previous studies. Toth et al. (1995) found that inactivation of the mouse 'jerky' gene results in epileptic seizures. See 603210. Zeng et al. (1997) identified a human tonsil cDNA encoding a protein similar to jerky. They designated the predicted 442-amino acid pro-

tein HHMJG (human homolog of mouse jerky gene). The HHMJG and mouse jerky proteins are 35% identical. Northern blot analysis revealed that HHMJG is abundantly expressed as a 4-kb mRNA in various tissues. In testis, an additional 2-kb transcript is present. By fluorescence in situ hybridization, Zeng et al. (1997) mapped the HHMJG gene to 11q21.

[53065] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53066] Toth, M.; Grimsby, J.; Buzsaki, G.; Donovan, G. P. : Epileptic seizures caused by inactivation of a novel gene, jerky, related to centromere binding protein-B in transgenic mice. *Nature Genet.* 11: 71–75, 1995. Note: Erratum: *Nature Genet.* 12: 110 only, 1996. ; and

[53067] Zeng, Z.; Kyaw, H.; Gakenheimer, K. R.; Augustus, M.; Fan, P.; Zhang, X.; Su, K.; Carter, K. C.; Li, Y. : Cloning, mapping, and tissue distribution of a human homologue of the mouse jerk.

[53068] Further studies establishing the function and utilities of JRKL are found in John Hopkins OMIM database record ID 603211, and in cited publications numbered 5438–5439 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Microtubule-associated Protein 7 (MAP7, Accession NM\_003980) is another VGAM1546 host target gene. MAP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP7 BINDING SITE, designated SEQ ID:10116, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53069] Another function of VGAM1546 is therefore inhibition of Microtubule-associated Protein 7 (MAP7, Accession NM\_003980), a gene which Microtubule-associated protein 7; stabilizes microtubules, may help establish epithelial cell polarity. Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP7. The function of MAP7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1373. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507) is another VGAM1546 host

target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, designated SEQ ID:8329, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53070] Another function of VGAM1546 is therefore inhibition of Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM212.CNIL (Accession NM\_005776) is another VGAM1546 host target gene. CNIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNIL, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNIL BINDING SITE, designated SEQ ID:12352, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53071] Another function of VGAM1546 is therefore inhibition of CNIL (Accession NM\_005776). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNIL. FLJ10154 (Accession NM\_018011) is another VGAM1546 host target gene. FLJ10154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10154 BINDING SITE, designated SEQ ID:19745, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53072] Another function of VGAM1546 is therefore inhibition of FLJ10154 (Accession NM\_018011). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

FLJ10154. FLJ10607 (Accession XM\_085119) is another VGAM1546 host target gene. FLJ10607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10607 BINDING SITE, designated SEQ ID:37834, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53073] Another function of VGAM1546 is therefore inhibition of FLJ10607 (Accession XM\_085119). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10607. FLJ20189 (Accession NM\_017704) is another VGAM1546 host target gene. FLJ20189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20189 BINDING SITE, designated SEQ ID:19278, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM

RNA, also designated SEQ ID:4257.

[53074] Another function of VGAM1546 is therefore inhibition of FLJ20189 (Accession NM\_017704). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20189. KIAA1237 (Accession XM\_087386) is another VGAM1546 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE, designated SEQ ID:39217, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53075] Another function of VGAM1546 is therefore inhibition of KIAA1237 (Accession XM\_087386). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. KIAA1573 (Accession XM\_031545) is another VGAM1546 host target gene. KIAA1573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1573, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1573 BINDING SITE, designated SEQ ID:31413, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53076] Another function of VGAM1546 is therefore inhibition of KIAA1573 (Accession XM\_031545). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1573. KIAA1579 (Accession NM\_018211) is another VGAM1546 host target gene. KIAA1579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1579 BINDING SITE, designated SEQ ID:20118, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53077] Another function of VGAM1546 is therefore inhibition of KIAA1579 (Accession NM\_018211). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1579. Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM\_020841) is another VGAM1546 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:21903, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53078] Another function of VGAM1546 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM\_020841). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. P21 (CDKN1A)-activated Kinase 2 (PAK2, Accession XM\_039354) is another VGAM1546 host target gene. PAK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PAK2 BINDING SITE, designated SEQ ID:33061, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53079] Another function of VGAM1546 is therefore inhibition of P21 (CDKN1A)-activated Kinase 2 (PAK2, Accession XM\_039354). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK2. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM\_031296) is another VGAM1546 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:25328, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53080] Another function of VGAM1546 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM\_031296). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with RAB33B. Transducer of ERBB2, 2 (TOB2, Accession XM\_170995) is another VGAM1546 host target gene. TOB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOB2 BINDING SITE, designated SEQ ID:45760, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53081] Another function of VGAM1546 is therefore inhibition of Transducer of ERBB2, 2 (TOB2, Accession XM\_170995). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOB2. LOC158038 (Accession XM\_088446) is another VGAM1546 host target gene. LOC158038 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158038 BINDING SITE, desig-

nated SEQ ID:39699, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53082] Another function of VGAM1546 is therefore inhibition of LOC158038 (Accession XM\_088446). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158038. LOC51141 (Accession XM\_043953) is another VGAM1546 host target gene. LOC51141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51141 BINDING SITE, designated SEQ ID:34047, to the nucleotide sequence of VGAM1546 RNA, herein designated VGAM RNA, also designated SEQ ID:4257.

[53083] Another function of VGAM1546 is therefore inhibition of LOC51141 (Accession XM\_043953). Accordingly, utilities of VGAM1546 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51141. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1547 (VGAM1547) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53084] VGAM1547 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1547 was detected is described hereinabove with reference to Figs. 1–8.

[53085] VGAM1547 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53086] VGAM1547 gene encodes a VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1547 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1547 precursor RNA is designated SEQ ID:1533, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1533 is located at position 64695 relative to the

genome of Vaccinia Virus.

[53087] VGAM1547 precursor RNA folds onto itself, forming VGAM1547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53088] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1547 folded precursor RNA into VGAM1547 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1547 RNA is designated SEQ ID:4258, and is provided hereinbelow with reference to the sequence listing part.

[53089] VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1547 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[53090] VGAM1547 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1547 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1547 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53091] The complementary binding of VGAM1547 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1547 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1547 host target RNA into VGAM1547 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53092] It is appreciated that VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1547 host target genes. The mRNA of each one of this plurality of VGAM1547 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1547 RNA, herein designated VGAM RNA, and which when bound by VGAM1547 RNA causes inhibition of translation of respective one or more VGAM1547 host target proteins.

[53093] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1547 gene, herein designated VGAM GENE, on one or more VGAM1547 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53094] It is yet further appreciated that a function of VGAM1547 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM1547 corre-

late with, and may be deduced from, the identity of the host target genes which VGAM1547 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53095] Nucleotide sequences of the VGAM1547 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1547 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1547 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1547 are further described hereinbelow with reference to Table 1.

[53096] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1547 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1547 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53097] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1547 gene, herein designated VGAM is inhibition of expression of VGAM1547 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1547 correlate with, and may be deduced

from, the identity of the target genes which VGAM1547 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53098] Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649) is a VGAM1547 host target gene. APXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APXL BINDING SITE, designated SEQ ID:7352, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53099] A function of VGAM1547 is therefore inhibition of Apical Protein-like (*Xenopus laevis*) (APXL, Accession NM\_001649), a gene which is implicated in amiloride-sensitive sodium channel activity. Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APXL. The function of APXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.Cockayne Syndrome 1 (classical) (CKN1, Ac-

cession NM\_000082) is another VGAM1547 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5529, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53100] Another function of VGAM1547 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is another VGAM1547 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9561, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM

RNA, also designated SEQ ID:4258.

[53101] Another function of VGAM1547 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Zinc Finger Protein 36 (K0X18) (ZNF36, Accession XM\_168302) is another VGAM1547 host target gene. ZNF36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF36 BINDING SITE, designated SEQ ID:45101, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53102] Another function of VGAM1547 is therefore inhibition of

Zinc Finger Protein 36 (K0X 18) (ZNF36, Accession XM\_168302), a gene which may be involved in transcriptional regulation. Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF36. The function of ZNF36 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM804.FLJ23191 (Accession NM\_024574) is another VGAM1547 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23803, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53103] Another function of VGAM1547 is therefore inhibition of FLJ23191 (Accession NM\_024574). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. KIAA0841 (Accession XM\_049237) is another

VGAM1547 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35359, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53104] Another function of VGAM1547 is therefore inhibition of KIAA0841 (Accession XM\_049237). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. Ring Finger Protein 20 (RNF20, Accession NM\_019592) is another VGAM1547 host target gene. RNF20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF20 BINDING SITE, designated SEQ ID:21213, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ

ID:4258.

[53105] Another function of VGAM1547 is therefore inhibition of Ring Finger Protein 20 (RNF20, Accession NM\_019592). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF20. LOC118851 (Accession XM\_061180) is another VGAM1547 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37199, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53106] Another function of VGAM1547 is therefore inhibition of LOC118851 (Accession XM\_061180). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118851. LOC150005 (Accession XM\_097795) is another VGAM1547 host target gene. LOC150005 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC150005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:41122, to the nucleotide sequence of VGAM1547 RNA, herein designated VGAM RNA, also designated SEQ ID:4258.

[53107] Another function of VGAM1547 is therefore inhibition of LOC150005 (Accession XM\_097795). Accordingly, utilities of VGAM1547 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1548 (VGAM1548) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53108] VGAM1548 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1548 was detected is described hereinabove with reference to Figs. 1-8.

[53109] VGAM1548 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53110] VGAM1548 gene encodes a VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1548 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1548 precursor RNA is designated SEQ ID:1534, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1534 is located at position 113488 relative to the genome of Macaca Mulatta Rhadinovirus.

[53111] VGAM1548 precursor RNA folds onto itself, forming VGAM1548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53112] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1548 folded precursor RNA into VGAM1548 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1548 RNA is designated SEQ ID:4259, and is provided hereinbelow with reference to the sequence listing part.

[53113] VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1548 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53114] VGAM1548 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1548 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1548 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53115] The complementary binding of VGAM1548 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1548 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1548

host target RNA into VGAM1548 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53116] It is appreciated that VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1548 host target genes. The mRNA of each one of this plurality of VGAM1548 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1548 RNA, herein designated VGAM RNA, and which when bound by VGAM1548 RNA causes inhibition of translation of respective one or more VGAM1548 host target proteins.

[53117] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1548 gene, herein designated VGAM GENE, on one or more VGAM1548 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53118] It is yet further appreciated that a function of VGAM1548 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1548 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1548 correlate with, and may be deduced from, the identity of the host target genes which VGAM1548 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53119] Nucleotide sequences of the VGAM1548 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1548 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1548 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1548 are further

described hereinbelow with reference to Table 1.

[53120] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1548 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1548 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53121] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1548 gene, herein designated VGAM is inhibition of expression of VGAM1548 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1548 correlate with, and may be deduced from, the identity of the target genes which VGAM1548 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53122] LOC92249 (Accession XM\_043814) is a VGAM1548 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE,

designated SEQ ID:34020, to the nucleotide sequence of VGAM1548 RNA, herein designated VGAM RNA, also designated SEQ ID:4259.

[53123] A function of VGAM1548 is therefore inhibition of LOC92249 (Accession XM\_043814). Accordingly, utilities of VGAM1548 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1549 (VGAM1549) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53124] VGAM1549 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1549 was detected is described hereinabove with reference to Figs. 1–8.

[53125] VGAM1549 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53126] VGAM1549 gene encodes a VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1549 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1549 precursor RNA is designated SEQ ID:1535, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1535 is located at position 117267 relative to the genome of Macaca Mulatta Rhadinovirus.

[53127] VGAM1549 precursor RNA folds onto itself, forming VGAM1549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1549 folded precursor RNA into VGAM1549 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide sequence of VGAM1549 RNA is designated SEQ ID:4260, and is provided hereinbelow with reference to the sequence listing part.

[53129] VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1549 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53130] VGAM1549 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1549 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1549 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53131] The complementary binding of VGAM1549 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1549 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1549 host target RNA into VGAM1549 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53132] It is appreciated that VGAM1549 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1549 host target genes. The mRNA of each one of this plurality of VGAM1549 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1549 RNA, herein designated VGAM RNA, and which when bound by VGAM1549 RNA causes inhibition of translation of respective one or more VGAM1549 host target proteins.

[53133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1549 gene, herein designated VGAM GENE, on one or more VGAM1549 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[53134] It is yet further appreciated that a function of VGAM1549 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1549 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1549 correlate with, and may be deduced from, the identity of the host target genes which VGAM1549 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53135] Nucleotide sequences of the VGAM1549 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1549 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1549 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1549 are further described hereinbelow with reference to Table 1.

[53136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1549 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1549 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53137] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1549 gene, herein designated VGAM is inhibition of expression of VGAM1549 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1549 correlate with, and may be deduced from, the identity of the target genes which VGAM1549 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53138] Msh Homeo Box Homolog 2 (Drosophila) (MSX2, Accession XM\_037646) is a VGAM1549 host target gene. MSX2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSX2 BINDING SITE, designated SEQ ID:32660, to the nucleotide sequence of VGAM1549 RNA, herein designated VGAM RNA, also designated SEQ ID:4260.

[53139] A function of VGAM1549 is therefore inhibition of Msh

Homeo Box Homolog 2 (Drosophila) (MSX2, Accession XM\_037646). Accordingly, utilities of VGAM1549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSX2. FLJ10244 (Accession NM\_018037) is another VGAM1549 host target gene. FLJ10244 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10244 BINDING SITE, designated SEQ ID:19780, to the nucleotide sequence of VGAM1549 RNA, herein designated VGAM RNA, also designated SEQ ID:4260.

[53140] Another function of VGAM1549 is therefore inhibition of FLJ10244 (Accession NM\_018037). Accordingly, utilities of VGAM1549 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10244. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1550 (VGAM1550) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[53141] VGAM1550 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1550 was detected is described hereinabove with reference to Figs. 1-8.

[53142] VGAM1550 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53143] VGAM1550 gene encodes a VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1550 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1550 precursor RNA is designated SEQ ID:1536, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1536 is located at position 114505 relative to the genome of Macaca Mulatta Rhadinovirus.

[53144] VGAM1550 precursor RNA folds onto itself, forming VGAM1550 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1550 folded precursor RNA into VGAM1550 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1550 RNA is designated SEQ ID:4261, and is provided hereinbelow with reference to the sequence listing part.

[53146] VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1550 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53147] VGAM1550 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1550 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1550 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53148] The complementary binding of VGAM1550 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1550 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1550 host target RNA into VGAM1550 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53149] It is appreciated that VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1550 host target genes. The mRNA of each one of this plurality of VGAM1550 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1550 RNA, herein designated VGAM RNA, and which when bound by VGAM1550 RNA causes inhibition of translation of respective one or more VGAM1550 host target proteins.

[53150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1550 gene, herein designated VGAM GENE, on one or more VGAM1550 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53151] It is yet further appreciated that a function of VGAM1550 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1550 correlate with, and may be deduced from, the identity of the host target genes which VGAM1550 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[53152] Nucleotide sequences of the VGAM1550 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1550 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1550 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1550 are further described hereinbelow with reference to Table 1.

[53153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1550 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1550 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1550 gene, herein designated VGAM is inhibition of expression of VGAM1550 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1550 correlate with, and may be deduced from, the identity of the target genes which VGAM1550 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53155] Vinculin (VCL, Accession NM\_003373) is a VGAM1550 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9401 and SEQ ID:15190 respectively, to the nucleotide sequence of VGAM1550 RNA, herein designated VGAM RNA, also designated SEQ ID:4261.

[53156] A function of VGAM1550 is therefore inhibition of Vinculin (VCL, Accession NM\_003373). Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. LOC145231 (Accession XM\_096740) is another VGAM1550 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:40519, to

the nucleotide sequence of VGAM1550 RNA, herein designated VGAM RNA, also designated SEQ ID:4261.

[53157] Another function of VGAM1550 is therefore inhibition of LOC145231 (Accession XM\_096740). Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. LOC221398 (Accession XM\_165762) is another VGAM1550 host target gene. LOC221398 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221398, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221398 BINDING SITE, designated SEQ ID:43750, to the nucleotide sequence of VGAM1550 RNA, herein designated VGAM RNA, also designated SEQ ID:4261.

[53158] Another function of VGAM1550 is therefore inhibition of LOC221398 (Accession XM\_165762). Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221398. LOC90594 (Accession XM\_032820) is another VGAM1550 host target gene. LOC90594 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC90594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90594 BINDING SITE, designated SEQ ID:31774, to the nucleotide sequence of VGAM1550 RNA, herein designated VGAM RNA, also designated SEQ ID:4261.

[53159] Another function of VGAM1550 is therefore inhibition of LOC90594 (Accession XM\_032820). Accordingly, utilities of VGAM1550 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90594. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1551 (VGAM1551) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53160] VGAM1551 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1551 was detected is described hereinabove with reference to Figs. 1-8.

[53161] VGAM1551 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53162] VGAM1551 gene encodes a VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1551 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1551 precursor RNA is designated SEQ ID:1537, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1537 is located at position 113655 relative to the genome of Macaca Mulatta Rhadinovirus.

[53163] VGAM1551 precursor RNA folds onto itself, forming VGAM1551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53164] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1551 folded precursor RNA into VGAM1551 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1551 RNA is designated SEQ ID:4262, and is provided hereinbelow with reference to the sequence listing part.

[53165] VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1551 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53166] VGAM1551 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1551 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1551 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53167] The complementary binding of VGAM1551 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1551 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1551

host target RNA into VGAM1551 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53168] It is appreciated that VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1551 host target genes. The mRNA of each one of this plurality of VGAM1551 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1551 RNA, herein designated VGAM RNA, and which when bound by VGAM1551 RNA causes inhibition of translation of respective one or more VGAM1551 host target proteins.

[53169] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1551 gene, herein designated VGAM GENE, on one or more VGAM1551 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53170] It is yet further appreciated that a function of VGAM1551 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1551 correlate with, and may be deduced from, the identity of the host target genes which VGAM1551 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53171] Nucleotide sequences of the VGAM1551 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1551 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1551 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1551 are further

described hereinbelow with reference to Table 1.

[53172] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1551 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1551 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53173] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1551 gene, herein designated VGAM is inhibition of expression of VGAM1551 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1551 correlate with, and may be deduced from, the identity of the target genes which VGAM1551 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53174] Calcium Channel, Voltage-dependent, Gamma Subunit 3 (CACNG3, Accession NM\_006539) is a VGAM1551 host target gene. CACNG3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CACNG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of CACNG3 BINDING SITE, designated SEQ ID:13292, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53175] A function of VGAM1551 is therefore inhibition of Calcium Channel, Voltage-dependent, Gamma Subunit 3 (CACNG3, Accession NM\_006539), a gene which is thought to stabilize the calcium channel in an inactivated state. Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNG3. The function of CACNG3 has been established by previous studies. Voltage-dependent calcium channels couple membrane depolarization in a number of cellular processes. These activities are regulated by distinct channels composed of alpha-1 (e.g., CACNA1D; 114206), beta (e.g., CACNB1; 114207), alpha-2/delta (e.g., CACNA2D1; 114204), and gamma (e.g., CACNG1; 114209) subunits. By genomic sequence analysis, Black and Lennon (1999) and Burgess et al. (1999) determined that the CACNG3 gene contains 4 exons with a large first intron.

[53176] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[53177] Black, J. L., III; Lennon, V. A. : Identification and cloning of putative human neuronal voltage-gated calcium channel gamma-2 and gamma-3 subunits: neurologic implications. Mayo Clin. Proc. 74: 357-361, 1999. ; and

[53178] Burgess, D. L.; Davis, C. F.; Gefrides, L. A.; Noebels, J. L. : Identification of three novel Ca(2+) channel gamma subunit genes reveals molecular diversification by tandem and chromoso.

[53179] Further studies establishing the function and utilities of CACNG3 are found in John Hopkins OMIM database record ID 606403, and in cited publications numbered 6188-4526 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Golgi Re-assembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899) is another VGAM1551 host target gene. GORASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GORASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GORASP1 BINDING SITE, designated SEQ ID:25646, to the nucleotide sequence of VGAM1551 RNA,

herein designated VGAM RNA, also designated SEQ ID:4262.

[53180] Another function of VGAM1551 is therefore inhibition of Golgi Reassembly Stacking Protein 1, 65kDa (GORASP1, Accession NM\_031899), a gene which has some function with the Golgi apparatus. Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GORASP1. The function of GORASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM630. Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310) is another VGAM1551 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8100, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53181] Another function of VGAM1551 is therefore inhibition of

Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM\_006245) is another VGAM1551 host target gene. PPP2R5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R5D BINDING SITE, designated SEQ ID:12918, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53182] Another function of VGAM1551 is therefore inhibition of Protein Phosphatase 2, Regulatory Subunit B (B56), Delta Isoform (PPP2R5D, Accession NM\_006245), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R5D. The function of PPP2R5D and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM96. Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191) is another VGAM1551 host target gene. C21orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf108 BINDING SITE, designated SEQ ID:42772, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53183] Another function of VGAM1551 is therefore inhibition of Chromosome 21 Open Reading Frame 108 (C21orf108, Accession XM\_114191). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf108. KIAA1161 (Accession XM\_088501) is another VGAM1551 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:39751, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53184] Another function of VGAM1551 is therefore inhibition of KIAA1161 (Accession XM\_088501). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. KIAA1862 (Accession XM\_044212) is another VGAM1551 host target gene. KIAA1862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1862 BINDING SITE, designated SEQ ID:34176, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53185] Another function of VGAM1551 is therefore inhibition of KIAA1862 (Accession XM\_044212). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1862. LOC148936 (Accession XM\_097556) is another VGAM1551 host target gene. LOC148936 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148936 BINDING SITE, designated SEQ ID:40930, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53186] Another function of VGAM1551 is therefore inhibition of LOC148936 (Accession XM\_097556). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148936. LOC148938 (Accession XM\_097555) is another VGAM1551 host target gene. LOC148938 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148938, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148938 BINDING SITE, designated SEQ ID:40923, to the nucleotide sequence of VGAM1551 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4262.

[53187] Another function of VGAM1551 is therefore inhibition of LOC148938 (Accession XM\_097555). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148938. LOC157273 (Accession XM\_098743) is another VGAM1551 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41782, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53188] Another function of VGAM1551 is therefore inhibition of LOC157273 (Accession XM\_098743). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC254057 (Accession XM\_173085) is another VGAM1551 host target gene. LOC254057 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254057, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254057 BINDING SITE, designated SEQ ID:46350, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53189] Another function of VGAM1551 is therefore inhibition of LOC254057 (Accession XM\_173085). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254057. LOC255465 (Accession XM\_173206) is another VGAM1551 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46449, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53190] Another function of VGAM1551 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC255465. LOC91947 (Accession XM\_041721) is another VGAM1551 host target gene. LOC91947 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91947, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91947 BINDING SITE, designated SEQ ID:33571, to the nucleotide sequence of VGAM1551 RNA, herein designated VGAM RNA, also designated SEQ ID:4262.

[53191] Another function of VGAM1551 is therefore inhibition of LOC91947 (Accession XM\_041721). Accordingly, utilities of VGAM1551 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91947. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1552 (VGAM1552) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53192] VGAM1552 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1552 was detected is described hereinabove with reference to Figs. 1–8.

[53193] VGAM1552 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53194] VGAM1552 gene encodes a VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1552 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1552 precursor RNA is designated SEQ ID:1538, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1538 is located at position 116594 relative to the genome of Macaca Mulatta Rhadinovirus.

[53195] VGAM1552 precursor RNA folds onto itself, forming VGAM1552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53196] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1552 folded precursor RNA into VGAM1552 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1552 RNA is designated SEQ ID:4263, and is provided hereinbelow with reference to the sequence listing part.

[53197] VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1552 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53198] VGAM1552 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1552 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1552 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53199] The complementary binding of VGAM1552 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1552 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1552 host target RNA into VGAM1552 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53200] It is appreciated that VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1552 host target genes. The mRNA of each one of this plurality of VGAM1552 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1552 RNA, herein designated VGAM RNA, and which when bound by VGAM1552 RNA causes inhibition of translation of respective one or more VGAM1552 host target proteins.

[53201] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1552 gene, herein designated VGAM GENE, on one or more VGAM1552 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53202] It is yet further appreciated that a function of VGAM1552 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1552 correlate with, and may be deduced from, the identity of the host target genes which VGAM1552 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53203] Nucleotide sequences of the VGAM1552 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1552 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1552 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1552 are further described hereinbelow with reference to Table 1.

[53204] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1552 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1552 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53205] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1552 gene, herein designated VGAM is inhibition of expression of VGAM1552 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1552 correlate with, and may be deduced from, the identity of the target genes which VGAM1552 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53206] Cadherin Related 23 (CDH23, Accession NM\_022124) is a VGAM1552 host target gene. CDH23 BINDING SITE1 and CDH23 BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by CDH23, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH23 BINDING SITE1 and CDH23 BINDING SITE2, designated SEQ ID:22671 and SEQ ID:27419 respectively, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53207] A function of VGAM1552 is therefore inhibition of Cadherin Related 23 (CDH23, Accession NM\_022124). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH23. Inositol Polyphosphate-4-phosphatase, Type I, 107kDa (INPP4A, Accession NM\_001566) is another VGAM1552 host target gene. INPP4A BINDING SITE1 and INPP4A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by INPP4A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP4A BINDING SITE1 and INPP4A BINDING SITE2, designated SEQ ID:7295

and SEQ ID:10247 respectively, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53208] Another function of VGAM1552 is therefore inhibition of Inositol Polyphosphate-4-phosphatase, Type I, 107kDa (INPP4A, Accession NM\_001566), a gene which catalyzes the hydrolysis of the 4-position phosphate of inositol 3,4-bisphosphate and inositol 1,3,4-trisphosphate. Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP4A. The function of INPP4A has been established by previous studies. Inositol polyphosphate 4-phosphatase catalyzes the hydrolysis of the 4-position phosphate of inositol 3,4-bisphosphate and inositol 1,3,4-trisphosphate. It also catalyzes, at a much higher rate, the hydrolysis of the 4-position phosphate of phosphatidylinositol 3,4-bisphosphate. Norris et al. (1995) noted that the latter activity has been implicated in mitogenesis mediated by PDGF receptor, the oxidative burst of neutrophils, and translocation of the glucose transporter to the plasma membrane. Norris et al. (1995) purified the enzyme from rat brain and obtained partial amino acid sequence from which degenerate primers were designed.

A PCR product was obtained and used to isolate a 5,607-bp composite cDNA which encodes a 939-amino acid reading frame from the rat. The authors screened a human brain cDNA library and identified a sequence that predicts a 938-amino acid protein which is 97% identical to the rat protein. Recombinant protein was shown to have the appropriate enzymatic activity. Northern blots indicated that, in the rat, the gene is widely expressed with highest levels in the brain, heart, and skeletal muscle

[53209] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53210] Joseph, R. E.; Walker, J.; Norris, F. A. : Assignment of the inositol polyphosphate 4-phosphatase type I gene (INPP4A) to human chromosome band 2q11.2 by in situ hybridization. *Cytogenet. Cell Genet.* 87: 276-277, 1999.  
; and

[53211] Norris, F. A.; Auethavekiat, V.; Majerus, P. W. : The isolation and characterization of cDNA encoding human and rat brain inositol polyphosphate 4-phosphatase. *J. Biol. Chem.* 270: 16128.

[53212] Further studies establishing the function and utilities of INPP4A are found in John Hopkins OMIM database record

ID 600916, and in cited publications numbered 9612–9613 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Topoisomerase (DNA) III Beta (TOP3B, Accession NM\_003935) is another VGAM1552 host target gene. TOP3B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TOP3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP3B BINDING SITE, designated SEQ ID:10038, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53213] Another function of VGAM1552 is therefore inhibition of Topoisomerase (DNA) III Beta (TOP3B, Accession NM\_003935). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP3B. Ubiquitin Specific Protease 1 (USP1, Accession NM\_003368) is another VGAM1552 host target gene. USP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by USP1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP1 BINDING SITE, designated SEQ ID:9392, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53214] Another function of VGAM1552 is therefore inhibition of Ubiquitin Specific Protease 1 (USP1, Accession NM\_003368). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP1. XT3 (Accession NM\_020208) is another VGAM1552 host target gene. XT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XT3 BINDING SITE, designated SEQ ID:21439, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53215] Another function of VGAM1552 is therefore inhibition of XT3 (Accession NM\_020208), a gene which is a Kidney-specific orphan transporter. Accordingly, utilities of

VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XT3. The function of XT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM21. Chromosome 20 Open Reading Frame 39 (C20orf39, Accession NM\_024893) is another VGAM1552 host target gene. C20orf39 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf39 BINDING SITE, designated SEQ ID:24369, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53216] Another function of VGAM1552 is therefore inhibition of Chromosome 20 Open Reading Frame 39 (C20orf39, Accession NM\_024893). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf39. EHM2 (Accession NM\_019114) is another VGAM1552 host target gene. EHM2 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by EHM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EHM2 BINDING SITE, designated SEQ ID:21189, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53217] Another function of VGAM1552 is therefore inhibition of EHM2 (Accession NM\_019114). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EHM2. FLJ10116 (Accession NM\_018000) is another VGAM1552 host target gene. FLJ10116 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10116, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10116 BINDING SITE, designated SEQ ID:19727, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53218] Another function of VGAM1552 is therefore inhibition of FLJ10116 (Accession NM\_018000). Accordingly, utilities of

VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10116. KIAA0217 (Accession XM\_040265) is another VGAM1552 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33283, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53219] Another function of VGAM1552 is therefore inhibition of KIAA0217 (Accession XM\_040265). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0427 (Accession NM\_014772) is another VGAM1552 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0427 BINDING SITE, designated SEQ ID:16577, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53220] Another function of VGAM1552 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. KIAA0618 (Accession NM\_014833) is another VGAM1552 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16836, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53221] Another function of VGAM1552 is therefore inhibition of KIAA0618 (Accession NM\_014833). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA0649 (Accession NM\_014811) is another VGAM1552 host target gene. KIAA0649 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0649 BINDING SITE, designated SEQ ID:16774, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53222] Another function of VGAM1552 is therefore inhibition of KIAA0649 (Accession NM\_014811). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0649. PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889) is another VGAM1552 host target gene. PC-QAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCQAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCQAP BINDING SITE, designated SEQ ID:18033, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ

ID:4263.

[53223] Another function of VGAM1552 is therefore inhibition of PC2 (positive cofactor 2, multiprotein complex) Glutamine/Q-rich-associated Protein (PCQAP, Accession NM\_015889). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCQAP. Solute Carrier Family 16 (monocarboxylic acid transporters), Member 10 (SLC16A10, Accession NM\_018593) is another VGAM1552 host target gene. SLC16A10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC16A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC16A10 BINDING SITE, designated SEQ ID:20673, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53224] Another function of VGAM1552 is therefore inhibition of Solute Carrier Family 16 (monocarboxylic acid transporters), Member 10 (SLC16A10, Accession NM\_018593). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with SLC16A10. LOC125704 (Accession XM\_058931) is another VGAM1552 host target gene. LOC125704 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC125704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125704 BINDING SITE, designated SEQ ID:36800, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53225] Another function of VGAM1552 is therefore inhibition of LOC125704 (Accession XM\_058931). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125704. LOC134121 (Accession XM\_059692) is another VGAM1552 host target gene. LOC134121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC134121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC134121 BINDING SITE, designated SEQ ID:37064, to

the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53226] Another function of VGAM1552 is therefore inhibition of LOC134121 (Accession XM\_059692). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC134121. LOC145945 (Accession XM\_096908) is another VGAM1552 host target gene. LOC145945 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:40634, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53227] Another function of VGAM1552 is therefore inhibition of LOC145945 (Accession XM\_096908). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC158263 (Accession XM\_088530) is another VGAM1552 host target gene. LOC158263 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158263 BINDING SITE, designated SEQ ID:39799, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53228] Another function of VGAM1552 is therefore inhibition of LOC158263 (Accession XM\_088530). Accordingly, utilities of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158263. LOC253502 (Accession XM\_170561) is another VGAM1552 host target gene. LOC253502 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253502, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253502 BINDING SITE, designated SEQ ID:45383, to the nucleotide sequence of VGAM1552 RNA, herein designated VGAM RNA, also designated SEQ ID:4263.

[53229] Another function of VGAM1552 is therefore inhibition of LOC253502 (Accession XM\_170561). Accordingly, utilities

of VGAM1552 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253502. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1553 (VGAM1553) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53230] VGAM1553 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1553 was detected is described hereinabove with reference to Figs. 1-8.

[53231] VGAM1553 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53232] VGAM1553 gene encodes a VGAM1553 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1553 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1553 precursor RNA is designated SEQ ID:1539, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1539 is located at position 113170 relative to the genome of Macaca Mulatta Rhadinovirus.

- [53233] VGAM1553 precursor RNA folds onto itself, forming VGAM1553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53234] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1553 folded precursor RNA into VGAM1553 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1553 RNA is designated SEQ ID:4264, and

is provided hereinbelow with reference to the sequence listing part.

[53235] VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1553 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[53236] VGAM1553 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1553 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1553 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53237] The complementary binding of VGAM1553 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1553 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1553 host target RNA into VGAM1553 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53238] It is appreciated that VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1553 host target genes. The mRNA of each one of this plurality of VGAM1553 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1553 RNA, herein designated VGAM RNA, and which when bound by VGAM1553 RNA causes inhibition of translation of respective one or more VGAM1553 host target proteins.

[53239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1553 gene, herein designated VGAM GENE, on one or more VGAM1553 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53240] It is yet further appreciated that a function of VGAM1553 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1553 correlate with, and may be deduced from, the identity of the host target genes which VGAM1553 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53241] Nucleotide sequences of the VGAM1553 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1553 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1553 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1553 are further described hereinbelow with reference to Table 1.

[53242] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1553 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1553 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53243] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1553 gene, herein designated VGAM is inhibition of expression of VGAM1553 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1553 correlate with, and may be deduced from, the identity of the target genes which VGAM1553 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53244] DKFZP564O0463 (Accession NM\_014156) is a VGAM1553 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15442, to the nucleotide sequence of VGAM1553 RNA, herein designated VGAM RNA, also designated SEQ ID:4264.

[53245] A function of VGAM1553 is therefore inhibition of DKFZP564O0463 (Accession NM\_014156). Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0463. KIAA0987 (Accession NM\_012307) is another VGAM1553 host target gene. KIAA0987 BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0987 BINDING SITE, designated SEQ ID:14675, to the nucleotide sequence of VGAM1553 RNA, herein designated VGAM RNA, also designated SEQ ID:4264.

[53246] Another function of VGAM1553 is therefore inhibition of KIAA0987 (Accession NM\_012307). Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0987. LOC116411 (Accession XM\_058095) is another VGAM1553 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36571, to the nucleotide sequence of VGAM1553 RNA, herein designated VGAM RNA, also designated SEQ ID:4264.

[53247] Another function of VGAM1553 is therefore inhibition of

LOC116411 (Accession XM\_058095). Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC90620 (Accession XM\_032986) is another VGAM1553 host target gene. LOC90620 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90620 BINDING SITE, designated SEQ ID:31806, to the nucleotide sequence of VGAM1553 RNA, herein designated VGAM RNA, also designated SEQ ID:4264.

[53248] Another function of VGAM1553 is therefore inhibition of LOC90620 (Accession XM\_032986). Accordingly, utilities of VGAM1553 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90620. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1554 (VGAM1554) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[53249] VGAM1554 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1554 was detected is described hereinabove with reference to Figs. 1–8.

[53250] VGAM1554 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53251] VGAM1554 gene encodes a VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1554 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1554 precursor RNA is designated SEQ ID:1540, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1540 is located at position 118520 relative to the genome of Macaca Mulatta Rhadinovirus.

[53252] VGAM1554 precursor RNA folds onto itself, forming VGAM1554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53253] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1554 folded precursor RNA into VGAM1554 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1554 RNA is designated SEQ ID:4265, and is provided hereinbelow with reference to the sequence listing part.

[53254] VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1554 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[53255] VGAM1554 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1554 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1554 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[53256] The complementary binding of VGAM1554 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1554 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1554 host target RNA into VGAM1554 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53257] It is appreciated that VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1554 host target genes. The mRNA of each one of this plurality of VGAM1554 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1554 RNA, herein designated VGAM RNA, and which when bound by VGAM1554 RNA causes inhibition of translation of respective one or more VGAM1554 host target proteins.

[53258] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1554 gene, herein designated VGAM GENE, on one

or more VGAM1554 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53259] It is yet further appreciated that a function of VGAM1554 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1554 correlate with, and may be deduced from, the identity of the host target genes which VGAM1554 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53260] Nucleotide sequences of the VGAM1554 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1554 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1554 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1554 are further described hereinbelow with reference to Table 1.

[53261] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1554 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1554 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53262] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1554 gene, herein designated VGAM is inhibition of expression of VGAM1554 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1554 correlate with, and may be deduced from, the identity of the target genes which VGAM1554 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53263] ATPase, Aminophospholipid Transporter-like, Class I,

Type 8A, Member 2 (ATP8A2, Accession XM\_167916) is a VGAM1554 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44923, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53264] A function of VGAM1554 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM\_167916). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Lipin 1 (LPIN1, Accession XM\_041136) is another VGAM1554 host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BINDING SITE, designated SEQ ID:33465, to the nucleotide se-

quence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53265] Another function of VGAM1554 is therefore inhibition of Lipin 1 (LPIN1, Accession XM\_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Claudin 15 (CLDN15, Accession NM\_138429) is another VGAM1554 host target gene. CLDN15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN15 BINDING SITE, designated SEQ ID:28793, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53266] Another function of VGAM1554 is therefore inhibition of Claudin 15 (CLDN15, Accession NM\_138429). Accordingly,

utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN15. DKFZp762K222 (Accession XM\_048721) is another VGAM1554 host target gene. DKFZp762K222 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp762K222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762K222 BINDING SITE, designated SEQ ID:35235, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53267] Another function of VGAM1554 is therefore inhibition of DKFZp762K222 (Accession XM\_048721). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762K222. FLJ10932 (Accession NM\_018277) is another VGAM1554 host target gene. FLJ10932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ10932 BINDING SITE, designated SEQ ID:20265, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53268] Another function of VGAM1554 is therefore inhibition of FLJ10932 (Accession NM\_018277). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10932. FLJ23231 (Accession NM\_025079) is another VGAM1554 host target gene. FLJ23231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23231 BINDING SITE, designated SEQ ID:24680, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53269] Another function of VGAM1554 is therefore inhibition of FLJ23231 (Accession NM\_025079). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23231. PIG7 (Accession NM\_004862) is another

VGAM1554 host target gene. PIG7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PIG7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIG7 BINDING SITE, designated SEQ ID:11270, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53270] Another function of VGAM1554 is therefore inhibition of PIG7 (Accession NM\_004862). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIG7. LOC152317 (Accession XM\_098189) is another VGAM1554 host target gene. LOC152317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152317 BINDING SITE, designated SEQ ID:41469, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53271] Another function of VGAM1554 is therefore inhibition of LOC152317 (Accession XM\_098189). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152317. LOC196761 (Accession XM\_116865) is another VGAM1554 host target gene. LOC196761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196761 BINDING SITE, designated SEQ ID:43129, to the nucleotide sequence of VGAM1554 RNA, herein designated VGAM RNA, also designated SEQ ID:4265.

[53272] Another function of VGAM1554 is therefore inhibition of LOC196761 (Accession XM\_116865). Accordingly, utilities of VGAM1554 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196761. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1555 (VGAM1555) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[53273] VGAM1555 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1555 was detected is described hereinabove with reference to Figs. 1–8.

[53274] VGAM1555 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53275] VGAM1555 gene encodes a VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1555 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1555 precursor RNA is designated SEQ ID:1541, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1541 is located at position 118330 relative to the genome of Macaca Mulatta Rhadinovirus.

[53276] VGAM1555 precursor RNA folds onto itself, forming VGAM1555 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53277] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1555 folded precursor RNA into VGAM1555 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM1555 RNA is designated SEQ ID:4266, and is provided hereinbelow with reference to the sequence listing part.

[53278] VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1555 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53279] VGAM1555 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1555 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1555 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53280] The complementary binding of VGAM1555 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1555 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1555 host target RNA into VGAM1555 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53281] It is appreciated that VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1555 host target genes. The mRNA of each one of this plurality of VGAM1555 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1555 RNA, herein designated VGAM RNA, and which when bound by VGAM1555 RNA causes inhibition of translation of respective one or more VGAM1555 host target proteins.

[53282] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1555 gene, herein designated VGAM GENE, on one or more VGAM1555 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53283] It is yet further appreciated that a function of VGAM1555 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1555 correlate with, and may be deduced from, the identity of the host target genes which VGAM1555 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[53284] Nucleotide sequences of the VGAM1555 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1555 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1555 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1555 are further described hereinbelow with reference to Table 1.

[53285] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1555 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1555 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53286] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1555 gene, herein designated VGAM is inhibition of expression of VGAM1555 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1555 correlate with, and may be deduced from, the identity of the target genes which VGAM1555 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53287] Colony Stimulating Factor 1 Receptor, Formerly McDonough Feline Sarcoma Viral (v-fms) Oncogene Homolog (CSF1R, Accession NM\_005211) is a VGAM1555 host target gene. CSF1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSF1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSF1R BINDING SITE, designated SEQ ID:11709, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53288] A function of VGAM1555 is therefore inhibition of Colony Stimulating Factor 1 Receptor, Formerly McDonough Feline Sarcoma Viral (v-fms) Oncogene Homolog (CSF1R, Accession NM\_005211), a gene which is involved in regulation of growth and differentiation of myeloid cells. Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSF1R. The function of CSF1R and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM297. Neurobeachin (NBEA,

Accession XM\_170732) is another VGAM1555 host target gene. NBEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBEA BINDING SITE, designated SEQ ID:45493, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53289] Another function of VGAM1555 is therefore inhibition of Neurobeachin (NBEA, Accession XM\_170732), a gene which may mediate protein-protein interactions. Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBEA. The function of NBEA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM459.EDR3 (Accession XM\_172303) is another VGAM1555 host target gene. EDR3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EDR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of EDR3 BINDING SITE, designated SEQ ID:46068, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53290] Another function of VGAM1555 is therefore inhibition of EDR3 (Accession XM\_172303). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EDR3. FLJ14621 (Accession NM\_032811) is another VGAM1555 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26581, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53291] Another function of VGAM1555 is therefore inhibition of FLJ14621 (Accession NM\_032811). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. KIAA1157 (Accession XM\_051093) is another

VGAM1555 host target gene. KIAA1157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1157 BINDING SITE, designated SEQ ID:35753, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53292] Another function of VGAM1555 is therefore inhibition of KIAA1157 (Accession XM\_051093). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1157. Oxysterol Binding Protein-like 6 (OSBPL6, Accession NM\_032523) is another VGAM1555 host target gene. OSBPL6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OSBPL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL6 BINDING SITE, designated SEQ ID:26270, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ

ID:4266.

[53293] Another function of VGAM1555 is therefore inhibition of Oxysterol Binding Protein-like 6 (OSBPL6, Accession NM\_032523). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL6. LOC221583 (Accession XM\_166396) is another VGAM1555 host target gene. LOC221583 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:44246, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53294] Another function of VGAM1555 is therefore inhibition of LOC221583 (Accession XM\_166396). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583. LOC253943 (Accession XM\_171195) is another VGAM1555 host target gene. LOC253943 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC253943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253943 BINDING SITE, designated SEQ ID:45984, to the nucleotide sequence of VGAM1555 RNA, herein designated VGAM RNA, also designated SEQ ID:4266.

[53295] Another function of VGAM1555 is therefore inhibition of LOC253943 (Accession XM\_171195). Accordingly, utilities of VGAM1555 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253943. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1556 (VGAM1556) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53296] VGAM1556 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1556 was detected is described hereinabove with reference to Figs. 1-8.

[53297] VGAM1556 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53298] VGAM1556 gene encodes a VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1556 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1556 precursor RNA is designated SEQ ID:1542, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1542 is located at position 114675 relative to the genome of Macaca Mulatta Rhadinovirus.

[53299] VGAM1556 precursor RNA folds onto itself, forming VGAM1556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53300] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1556 folded precursor RNA into VGAM1556 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1556 RNA is designated SEQ ID:4267, and is provided hereinbelow with reference to the sequence listing part.

[53301] VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1556 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53302] VGAM1556 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1556 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1556 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53303] The complementary binding of VGAM1556 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1556 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1556

host target RNA into VGAM1556 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53304] It is appreciated that VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1556 host target genes. The mRNA of each one of this plurality of VGAM1556 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1556 RNA, herein designated VGAM RNA, and which when bound by VGAM1556 RNA causes inhibition of translation of respective one or more VGAM1556 host target proteins.

[53305] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1556 gene, herein designated VGAM GENE, on one or more VGAM1556 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53306] It is yet further appreciated that a function of VGAM1556 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1556 correlate with, and may be deduced from, the identity of the host target genes which VGAM1556 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53307] Nucleotide sequences of the VGAM1556 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1556 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1556 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1556 are further

described hereinbelow with reference to Table 1.

[53308] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1556 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1556 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53309] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1556 gene, herein designated VGAM is inhibition of expression of VGAM1556 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1556 correlate with, and may be deduced from, the identity of the target genes which VGAM1556 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53310] Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963) is a VGAM1556 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33841, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53311] A function of VGAM1556 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Multiple Endocrine Neoplasia I (MEN1, Accession NM\_130803) is another VGAM1556 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:28295, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53312] Another function of VGAM1556 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession NM\_130803). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical

cal conditions associated with MEN1. Myosin X (MYO10, Accession NM\_012334) is another VGAM1556 host target gene. MYO10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MYO10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO10 BINDING SITE, designated SEQ ID:14728, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53313] Another function of VGAM1556 is therefore inhibition of Myosin X (MYO10, Accession NM\_012334), a gene which is an unconventional myosin. Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO10. The function of MYO10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM28. Bromodomain Containing 4 (BRD4, Accession NM\_058243) is another VGAM1556 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BRD4,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:27777, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53314] Another function of VGAM1556 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM\_058243). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. FLJ10415 (Accession NM\_018089) is another VGAM1556 host target gene. FLJ10415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10415 BINDING SITE, designated SEQ ID:19852, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53315] Another function of VGAM1556 is therefore inhibition of FLJ10415 (Accession NM\_018089). Accordingly, utilities of

VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10415. FLJ12768 (Accession NM\_025163) is another VGAM1556 host target gene. FLJ12768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12768 BINDING SITE, designated SEQ ID:24802, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53316] Another function of VGAM1556 is therefore inhibition of FLJ12768 (Accession NM\_025163). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12768. ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM\_047951) is another VGAM1556 host target gene. ISL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ISL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of ISL2 BINDING SITE, designated SEQ ID:35079, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53317] Another function of VGAM1556 is therefore inhibition of ISL2 Transcription Factor, LIM/homeodomain, (islet-2) (ISL2, Accession XM\_047951). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ISL2. PDEF (Accession NM\_012391) is another VGAM1556 host target gene. PDEF BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDEF BINDING SITE, designated SEQ ID:14745, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53318] Another function of VGAM1556 is therefore inhibition of PDEF (Accession NM\_012391). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDEF.

SCYB11 (Accession XM\_113426) is another VGAM1556 host target gene. SCYB11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB11 BINDING SITE, designated SEQ ID:42258, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53319] Another function of VGAM1556 is therefore inhibition of SCYB11 (Accession XM\_113426). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB11. LOC147299 (Accession XM\_085763) is another VGAM1556 host target gene. LOC147299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147299 BINDING SITE, designated SEQ ID:38328, to the nucleotide sequence of VGAM1556 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4267.

[53320] Another function of VGAM1556 is therefore inhibition of LOC147299 (Accession XM\_085763). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147299. LOC93268 (Accession XM\_050158) is another VGAM1556 host target gene. LOC93268 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93268 BINDING SITE, designated SEQ ID:35585, to the nucleotide sequence of VGAM1556 RNA, herein designated VGAM RNA, also designated SEQ ID:4267.

[53321] Another function of VGAM1556 is therefore inhibition of LOC93268 (Accession XM\_050158). Accordingly, utilities of VGAM1556 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93268. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1557 (VGAM1557) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53322] VGAM1557 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1557 was detected is described hereinabove with reference to Figs. 1–8.

[53323] VGAM1557 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Macaca Mulatta Rhadinovirus. VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53324] VGAM1557 gene encodes a VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1557 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1557 precursor RNA is designated SEQ ID:1543, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1543 is located at position 114790 relative to the genome of Macaca Mulatta Rhadinovirus.

[53325] VGAM1557 precursor RNA folds onto itself, forming

VGAM1557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53326] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1557 folded precursor RNA into VGAM1557 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1557 RNA is designated SEQ ID:4268, and is provided hereinbelow with reference to the sequence listing part.

[53327] VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1557 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53328] VGAM1557 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1557 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1557 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53329] The complementary binding of VGAM1557 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1557 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1557 host target RNA into VGAM1557 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53330] It is appreciated that VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1557 host target genes. The mRNA of each one of this plurality of VGAM1557 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1557 RNA, herein designated VGAM RNA, and which when bound by VGAM1557 RNA causes inhibition of translation of respective one or more VGAM1557 host target proteins.

[53331] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1557 gene, herein designated VGAM GENE, on one or more VGAM1557 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53332] It is yet further appreciated that a function of VGAM1557 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of viral infection by Macaca Mulatta Rhadinovirus. Specific functions, and accordingly utilities, of VGAM1557 correlate with, and may be deduced from, the identity of the host target genes which VGAM1557 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53333] Nucleotide sequences of the VGAM1557 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1557 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1557 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1557 are further described hereinbelow with reference to Table 1.

[53334] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1557 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1557 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53335] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1557 gene, herein designated VGAM is inhibition of expression of VGAM1557 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1557 correlate with, and may be deduced from, the identity of the target genes which VGAM1557 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[53336] Enabled Homolog (Drosophila) (ENAH, Accession NM\_018212) is a VGAM1557 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20124, to the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53337] A function of VGAM1557 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession NM\_018212). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. FLJ12484 (Accession NM\_022767) is another VGAM1557 host target gene. FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and

FLJ12484 BINDING SITE2, designated SEQ ID:23024 and SEQ ID:34522 respectively, to the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53338] Another function of VGAM1557 is therefore inhibition of FLJ12484 (Accession NM\_022767). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM\_007150) is another VGAM1557 host target gene. ZNF185 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF185, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF185 BINDING SITE, designated SEQ ID:14002, to the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53339] Another function of VGAM1557 is therefore inhibition of Zinc Finger Protein 185 (LIM domain) (ZNF185, Accession NM\_007150). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ZNF185. LOC145828 (Accession XM\_096879) is another VGAM1557 host target gene. LOC145828 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145828 BINDING SITE, designated SEQ ID:40612, to the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53340] Another function of VGAM1557 is therefore inhibition of LOC145828 (Accession XM\_096879). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145828. LOC152926 (Accession XM\_087562) is another VGAM1557 host target gene. LOC152926 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152926, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152926 BINDING SITE, designated SEQ ID:39340, to

the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53341] Another function of VGAM1557 is therefore inhibition of LOC152926 (Accession XM\_087562). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152926. LOC220662 (Accession XM\_165978) is another VGAM1557 host target gene. LOC220662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220662 BINDING SITE, designated SEQ ID:43824, to the nucleotide sequence of VGAM1557 RNA, herein designated VGAM RNA, also designated SEQ ID:4268.

[53342] Another function of VGAM1557 is therefore inhibition of LOC220662 (Accession XM\_165978). Accordingly, utilities of VGAM1557 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220662. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1558 (VGAM1558) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53343] VGAM1558 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1558 was detected is described hereinabove with reference to Figs. 1–8.

[53344] VGAM1558 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53345] VGAM1558 gene encodes a VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1558 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1558 precursor RNA is designated SEQ ID:1544, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1544 is located at position 8996 relative to the genome of Bean Common Mosaic Virus.

[53346] VGAM1558 precursor RNA folds onto itself, forming VGAM1558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53347] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1558 folded precursor RNA into VGAM1558 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1558 RNA is designated SEQ ID:4269, and is provided hereinbelow with reference to the sequence listing part.

[53348] VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1558 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1558 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53349] VGAM1558 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1558 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1558 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53350] The complementary binding of VGAM1558 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1558 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1558 host target RNA into VGAM1558 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53351] It is appreciated that VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1558 host target genes. The mRNA of each one of this plurality of VGAM1558 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1558 RNA, herein designated VGAM RNA, and which when bound by VGAM1558 RNA causes inhibition of translation of respective one or more VGAM1558 host target proteins.

[53352] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1558 gene, herein designated VGAM GENE, on one or more VGAM1558 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53353] It is yet further appreciated that a function of VGAM1558 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1558 correlate with, and may be deduced from, the

identity of the host target genes which VGAM1558 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53354] Nucleotide sequences of the VGAM1558 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1558 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1558 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1558 are further described hereinbelow with reference to Table 1.

[53355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1558 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1558 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53356] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1558 gene, herein designated VGAM is inhibition of expression of VGAM1558 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1558 correlate with, and may be deduced from, the identity of the target genes which VGAM1558

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53357] Ceroid–lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM\_017882) is a VGAM1558 host target gene. CLN6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN6 BINDING SITE, designated SEQ ID:19549, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53358] A function of VGAM1558 is therefore inhibition of Ceroid–lipofuscinosis, Neuronal 6, Late Infantile, Variant (CLN6, Accession NM\_017882). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN6. Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM\_003633) is another VGAM1558 host target gene. ENC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ENC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta–

ble 2 illustrates the complementarity of the nucleotide sequences of ENC1 BINDING SITE, designated SEQ ID:9696, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53359] Another function of VGAM1558 is therefore inhibition of Ectodermal–neural Cortex (with BTB–like domain) (ENC1, Accession NM\_003633), a gene which is an actin–binding protein involved in the regulation of neuronal process formation and in differentiation of neural crest cells. Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENC1. The function of ENC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM233.Procollagen–lysine, 2–oxoglutarate 5–dioxygenase (lysine hydroxylase, Ehlers–Danlos syndrome type VI) (PLOD, Accession NM\_000302) is another VGAM1558 host target gene. PLOD BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLOD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of PLOD BINDING SITE, designated SEQ ID:5843, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53360] Another function of VGAM1558 is therefore inhibition of Procollagen-lysine, 2-oxoglutarate 5-dioxygenase (lysine hydroxylase, Ehlers-Danlos syndrome type VI) (PLOD, Accession NM\_000302). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLOD. Pyrroline-5-carboxylate Synthetase (glutamate gamma-semialdehyde synthetase) (PYCS, Accession NM\_002860) is another VGAM1558 host target gene. PYCS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYCS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYCS BINDING SITE, designated SEQ ID:8760, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53361] Another function of VGAM1558 is therefore inhibition of Pyrroline-5-carboxylate Synthetase (glutamate gamma-semialdehyde synthetase) (PYCS, Accession NM\_002860).

Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYCS. CASPR3 (Accession NM\_024879) is another VGAM1558 host target gene. CASPR3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CASPR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASPR3 BINDING SITE, designated SEQ ID:24315, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53362] Another function of VGAM1558 is therefore inhibition of CASPR3 (Accession NM\_024879). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASPR3. KIAA1040 (Accession XM\_051091) is another VGAM1558 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35745, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53363] Another function of VGAM1558 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1764 (Accession XM\_045086) is another VGAM1558 host target gene. KIAA1764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1764 BINDING SITE, designated SEQ ID:34352, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53364] Another function of VGAM1558 is therefore inhibition of KIAA1764 (Accession XM\_045086). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1764. KIAA1854 (Accession XM\_049884) is another

VGAM1558 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35529, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53365] Another function of VGAM1558 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. LOC200197 (Accession XM\_114148) is another VGAM1558 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:42729, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53366] Another function of VGAM1558 is therefore inhibition of LOC200197 (Accession XM\_114148). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. LOC203232 (Accession XM\_049274) is another VGAM1558 host target gene. LOC203232 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203232 BINDING SITE, designated SEQ ID:35373, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53367] Another function of VGAM1558 is therefore inhibition of LOC203232 (Accession XM\_049274). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203232. LOC90233 (Accession NM\_138347) is another VGAM1558 host target gene. LOC90233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90233, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90233 BINDING SITE, designated SEQ ID:28742, to the nucleotide sequence of VGAM1558 RNA, herein designated VGAM RNA, also designated SEQ ID:4269.

[53368] Another function of VGAM1558 is therefore inhibition of LOC90233 (Accession NM\_138347). Accordingly, utilities of VGAM1558 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90233. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1559 (VGAM1559) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53369] VGAM1559 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1559 was detected is described hereinabove with reference to Figs. 1–8.

[53370] VGAM1559 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1559 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53371] VGAM1559 gene encodes a VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1559 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1559 precursor RNA is designated SEQ ID:1545, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1545 is located at position 3572 relative to the genome of Bean Common Mosaic Virus.

[53372] VGAM1559 precursor RNA folds onto itself, forming VGAM1559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53373] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1559 folded precursor RNA into VGAM1559

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1559 RNA is designated SEQ ID:4270, and is provided hereinbelow with reference to the sequence listing part.

[53374] VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1559 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53375] VGAM1559 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1559 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1559 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53376] The complementary binding of VGAM1559 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1559 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1559 host target RNA into VGAM1559 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[53377] It is appreciated that VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1559 host target genes. The mRNA of each one of this plurality of VGAM1559 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1559 RNA, herein designated VGAM RNA, and which when bound by VGAM1559 RNA causes inhibition of translation of respective one or more VGAM1559 host target proteins.

[53378] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1559 gene, herein designated VGAM GENE, on one or more VGAM1559 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53379] It is yet further appreciated that a function of VGAM1559 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1559 correlate with, and may be deduced from, the identity of the host target genes which VGAM1559 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53380] Nucleotide sequences of the VGAM1559 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1559 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1559 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1559 are further described hereinbelow with reference to Table 1.

[53381] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1559 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1559 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53382] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1559 gene, herein designated VGAM is inhibition of expression of VGAM1559 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1559 correlate with, and may be deduced from, the identity of the target genes which VGAM1559 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53383] Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496) is a VGAM1559 host target gene. GNAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI3 BINDING SITE, designated SEQ ID:13239, to the

nucleotide sequence of VGAM1559 RNA, herein designated VGAM RNA, also designated SEQ ID:4270.

[53384] A function of VGAM1559 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM\_006496), a gene which stimulates receptor regulated K<sup>+</sup>-channels. Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI3. The function of GNAI3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM45.Chondrolectin (CHODL, Accession NM\_024944) is another VGAM1559 host target gene. CHODL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHODL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHODL BINDING SITE, designated SEQ ID:24489, to the nucleotide sequence of VGAM1559 RNA, herein designated VGAM RNA, also designated SEQ ID:4270.

[53385] Another function of VGAM1559 is therefore inhibition of

Chondrolectin (CHODL, Accession NM\_024944). Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHODL. KIAA0416 (Accession NM\_015564) is another VGAM1559 host target gene. KIAA0416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0416 BINDING SITE, designated SEQ ID:17832, to the nucleotide sequence of VGAM1559 RNA, herein designated VGAM RNA, also designated SEQ ID:4270.

[53386] Another function of VGAM1559 is therefore inhibition of KIAA0416 (Accession NM\_015564). Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0416. LOC145951 (Accession XM\_085283) is another VGAM1559 host target gene. LOC145951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC145951 BINDING SITE, designated SEQ ID:38016, to the nucleotide sequence of VGAM1559 RNA, herein designated VGAM RNA, also designated SEQ ID:4270.

[53387] Another function of VGAM1559 is therefore inhibition of LOC145951 (Accession XM\_085283). Accordingly, utilities of VGAM1559 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145951. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1560 (VGAM1560) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53388] VGAM1560 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1560 was detected is described hereinabove with reference to Figs. 1–8.

[53389] VGAM1560 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[53390] VGAM1560 gene encodes a VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1560 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1560 precursor RNA is designated SEQ ID:1546, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1546 is located at position 6352 relative to the genome of Bean Common Mosaic Virus.

[53391] VGAM1560 precursor RNA folds onto itself, forming VGAM1560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53392] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1560 folded precursor RNA into VGAM1560 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1560 RNA is designated SEQ ID:4271, and is provided hereinbelow with reference to the sequence listing part.

[53393] VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1560 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53394] VGAM1560 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1560 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1560 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53395] The complementary binding of VGAM1560 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1560 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1560 host target RNA into VGAM1560 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53396] It is appreciated that VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1560 host target genes. The mRNA of each one of this plurality of VGAM1560 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1560 RNA, herein designated VGAM RNA, and which when bound by VGAM1560 RNA causes inhibition of translation of respective one or more VGAM1560 host target proteins.

[53397] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1560 gene, herein designated VGAM GENE, on one or more VGAM1560 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53398] It is yet further appreciated that a function of VGAM1560 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1560 correlate with, and may be deduced from, the identity of the host target genes which VGAM1560 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53399] Nucleotide sequences of the VGAM1560 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1560 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1560 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1560 are further described hereinbelow with reference to Table 1.

[53400] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1560 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1560 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53401] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1560 gene, herein designated VGAM is inhibition of expression of VGAM1560 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1560 correlate with, and may be deduced from, the identity of the target genes which VGAM1560 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53402] EPB72 (Accession NM\_004099) is a VGAM1560 host target gene. EPB72 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPB72, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB72 BINDING SITE, designated SEQ ID:10303, to the nucleotide sequence of VGAM1560 RNA, herein designated VGAM RNA, also designated SEQ ID:4271.

[53403] A function of VGAM1560 is therefore inhibition of EPB72 (Accession NM\_004099), a gene which may regulate cation conductance. Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB72. The function of EPB72 has been established by previous studies. Erythrocyte surface protein band 7.2 is a 29,000-kD integral membrane protein that is exposed on the cytoplasmic surface of the membrane and is susceptible to phosphorylation by a cAMP-dependent protein kinase. Deficiency of this protein in red cells is responsible for stomatocytosis (OMIM Ref. No. 185000). The same protein can be demonstrated in human cell lines of epithelial and lymphoid origin, notably in HeLa cells. Hiebl-Dirschmied et al. (1991), therefore, could screen HeLa cell cDNA expression libraries with antibodies to the protein in order to isolate cDNA clones, determine the nucleotide sequence, and study the structure of the protein. HeLa and bone marrow cell-derived sequences were identical, except for one nucleotide; the deduced sequence of 287 amino acids was confirmed by sequence identity with peptides of the erythroid protein. Structural analysis assigned band 7 protein to the type Ib transmembrane proteins. Westberg et al.

(1993) used a cDNA clone coding for stomatin to determine the chromosomal localization of the EPB72 gene. They assigned the gene to human chromosome 9 by Southern blot analysis of somatic cell hybrids. By analysis of hybrid cells containing only parts of chromosome 9, they regionalized the assignment to 9q34.1, proximal to the breakpoint that creates the Philadelphia chromosome of chronic myeloid leukemia (CML; 151410) and, therefore, proximal to the Abelson oncogene (OMIM Ref. No. 189980). Using fluorescence in situ hybridization, Gallagher et al. (1993) likewise mapped the EPB72 gene to 9q33–q34. They showed that EPB72 was not translocated with the 3–prime end of the ABL gene in the Philadelphia chromosome, suggesting that the EPB72 gene is centromeric to the ABL gene. Pilz et al. (1994) demonstrated that the homologous gene is located on mouse chromosome 2. To gain additional insight into the structure and function of this protein, Gallagher et al. (1995) cloned the mouse band 7.2b cDNA and studied its tissue-specific expression. They isolated 2,873 bp of cDNA with an open reading frame of 852 bp. The predicted protein was 284 amino acids with a molecular weight of 31 kD. They detected a wide pattern of expression, with high levels of

mRNA in heart, liver, skeletal muscle, and testis but low levels in lung, brain, and spleen. Using fluorescence in situ hybridization, the murine band 7.2b gene was mapped to chromosome 2, at the border of the distal region of 2B and proximal region of C1, syntenic to 9q, the location of the human homolog. Models of the predicted protein structure showed a short NH<sub>2</sub>-terminal head, a strongly hydrophobic 28-amino acid stretch presumably encoding a single membrane-spanning domain, and a large domain composed of beta sheet and alpha helix. Database searching showed no significant homology of other known proteins to either the human or the murine band 7.2b. Gallagher and Forget (1995) determined the sequence of the full-length human band 7.2b cDNA, characterized the genomic structure of the EPB72 gene, studied its pattern of expression in different tissues, and characterized the promoter of the gene. The gene is composed of 7 exons distributed over 40 kb of DNA. Its promoter was identified as lacking a TATA box and to be GC-rich. It directed high-level expression of a reporter gene in both erythroid and non-erythroid cells. Unfried et al. (1995) showed that the human EPB72 gene contains 7 exons spanning about 30 kb. Two polyadenylation signals

were found in the 3-prime UTR accounting for the 3.2- and 3.3-kb RNAs that are observed in Northern blots. Animal model experiments lend further support to the function of EPB72. To examine the relationship between erythrocyte membrane protein 7.2b deficiency and the hemolytic anemia of human hereditary stomatocytosis, Zhu et al. (1999) created 7.2b knockout mice by standard gene targeting approaches. Despite a complete absence of protein 7.2b in homozygous knockout mice, there was no hemolytic anemia, and mouse red blood cells were normal in morphology, cell indices, hydration status, monovalent cation content, and ability to translocate lipids. Thus, their experiments suggested that 7.2b deficiency plays no direct role in the etiology of stomatocytosis and excluded any role of this protein as a mediator of cation transport in red blood cells.

[53404] It is appreciated that the abovementioned animal model for EPB72 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[53405] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53406] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.; Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is absent in 'stomatin'-deficient murine red blood cells. Blood 93: 2404–2410, 1999. ; and

[53407] Zhu, Y.; Paszty, C.; Turetsky, T.; Tsai, S.; Kuypers, F. A.; Lee, G.; Cooper, P.; Gallagher, P. G.; Stevens, M. E.; Rubin, E.; Mohandas, N.; Mentzer, W. C. : Stomatocytosis is absent in.

[53408] Further studies establishing the function and utilities of EPB72 are found in John Hopkins OMIM database record ID 133090, and in cited publications numbered 4369–4376 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyaluronan-mediated Motility Receptor (RHAMM) (HMMR, Accession NM\_012484) is another VGAM1560 host target gene. HMMR BINDING SITE1 and HMMR BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HMMR, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMMR BINDING SITE1 and HMMR BINDING SITE2, design-

nated SEQ ID:14861 and SEQ ID:14863 respectively, to the nucleotide sequence of VGAM1560 RNA, herein designated VGAM RNA, also designated SEQ ID:4271.

[53409] Another function of VGAM1560 is therefore inhibition of Hyaluronan-mediated Motility Receptor (RHAMM) (HMMR, Accession NM\_012484). Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMMR. KIAA0354 (Accession NM\_014872) is another VGAM1560 host target gene. KIAA0354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0354 BINDING SITE, designated SEQ ID:16995, to the nucleotide sequence of VGAM1560 RNA, herein designated VGAM RNA, also designated SEQ ID:4271.

[53410] Another function of VGAM1560 is therefore inhibition of KIAA0354 (Accession NM\_014872). Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0354. LOC144308 (Accession XM\_096575) is another

VGAM1560 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40403, to the nucleotide sequence of VGAM1560 RNA, herein designated VGAM RNA, also designated SEQ ID:4271.

[53411] Another function of VGAM1560 is therefore inhibition of LOC144308 (Accession XM\_096575). Accordingly, utilities of VGAM1560 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1561 (VGAM1561) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53412] VGAM1561 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1561 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[53413] VGAM1561 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53414] VGAM1561 gene encodes a VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1561 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1561 precursor RNA is designated SEQ ID:1547, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1547 is located at position 7254 relative to the genome of Bean Common Mosaic Virus.

[53415] VGAM1561 precursor RNA folds onto itself, forming VGAM1561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53416] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1561 folded precursor RNA into VGAM1561 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1561 RNA is designated SEQ ID:4272, and is provided hereinbelow with reference to the sequence listing part.

[53417] VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1561 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53418] VGAM1561 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1561 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1561 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1561 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53419] The complementary binding of VGAM1561 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1561 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1561 host target RNA into VGAM1561 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53420] It is appreciated that VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1561 host target genes. The mRNA of each one of this plurality of VGAM1561 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1561 RNA, herein designated VGAM RNA, and which when bound by VGAM1561 RNA causes inhibition of translation of respective one or more VGAM1561 host target proteins.

[53421] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1561 gene, herein designated VGAM GENE, on one or more VGAM1561 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53422] It is yet further appreciated that a function of VGAM1561 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1561 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1561 correlate with, and may be deduced from, the identity of the host target genes which VGAM1561 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53423] Nucleotide sequences of the VGAM1561 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1561 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1561 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1561 are further described hereinbelow with reference to Table 1.

[53424] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1561 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1561 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53425] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1561 gene, herein designated VGAM is inhibition of expression of VGAM1561 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1561 correlate with, and may be deduced from, the identity of the target genes which VGAM1561 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53426] KIAA0872 (Accession NM\_014940) is a VGAM1561 host target gene. KIAA0872 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0872, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0872 BINDING SITE, designated SEQ ID:17243, to the nucleotide sequence of VGAM1561 RNA, herein designated VGAM RNA, also designated SEQ ID:4272.

[53427] A function of VGAM1561 is therefore inhibition of KIAA0872 (Accession NM\_014940). Accordingly, utilities of VGAM1561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0872. LOC219445 (Accession XM\_166212) is another VGAM1561 host target gene. LOC219445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219445 BINDING SITE, designated SEQ ID:44011, to the nucleotide sequence of VGAM1561 RNA, herein designated VGAM RNA, also designated SEQ ID:4272.

[53428] Another function of VGAM1561 is therefore inhibition of LOC219445 (Accession XM\_166212). Accordingly, utilities of VGAM1561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219445. LOC58525 (Accession XM\_086045) is another VGAM1561 host target gene. LOC58525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC58525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC58525 BINDING SITE, designated SEQ ID:38455, to the nucleotide sequence of VGAM1561 RNA, herein designated VGAM RNA, also designated SEQ ID:4272.

[53429] Another function of VGAM1561 is therefore inhibition of LOC58525 (Accession XM\_086045). Accordingly, utilities of VGAM1561 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC58525. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1562 (VGAM1562) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53430] VGAM1562 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1562 was detected is described hereinabove with reference to Figs. 1–8.

[53431] VGAM1562 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53432] VGAM1562 gene encodes a VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1562 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1562 precursor RNA is designated SEQ ID:1548, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1548 is located at position 2292 relative to the genome of Bean Common Mosaic Virus.

[53433] VGAM1562 precursor RNA folds onto itself, forming VGAM1562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53434] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1562 folded precursor RNA into VGAM1562 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1562 RNA is designated SEQ ID:4273, and is provided hereinbelow with reference to the sequence listing part.

[53435] VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1562 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53436] VGAM1562 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1562 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1562 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[53437] The complementary binding of VGAM1562 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1562 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1562 host target RNA into VGAM1562 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53438] It is appreciated that VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1562 host target genes. The mRNA of each one of this plurality of VGAM1562 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1562 RNA, herein designated VGAM RNA, and which when bound by VGAM1562 RNA causes inhibition of translation of respective one or more VGAM1562 host target proteins.

[53439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1562 gene, herein designated VGAM GENE, on one or more VGAM1562 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53440] It is yet further appreciated that a function of VGAM1562 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1562 correlate with, and may be deduced from, the identity of the host target genes which VGAM1562 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53441] Nucleotide sequences of the VGAM1562 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1562 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1562 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1562 are further described hereinbelow with reference to Table 1.

[53442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1562 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1562 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53443] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1562 gene, herein designated VGAM is inhibition of expression of VGAM1562 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1562 correlate with, and may be deduced from, the identity of the target genes which VGAM1562 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53444] Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557) is a VGAM1562 host target gene. CCRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCRL1, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:18630, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53445] A function of VGAM1562 is therefore inhibition of Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM\_016557), a gene which is a G protein-coupled receptor that binds chemokines of the CC subfamily, especially MCP-4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1. The function of CCRL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM546. Solute Carrier Family 26, Member 4 (SLC26A4, Accession NM\_000441) is another VGAM1562 host target gene. SLC26A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC26A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC26A4 BINDING SITE, designated SEQ ID:6027, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53446] Another function of VGAM1562 is therefore inhibition of Solute Carrier Family 26, Member 4 (SLC26A4, Accession NM\_000441). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A4. ALK7 (Accession XM\_065712) is another VGAM1562 host target gene. ALK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALK7 BINDING SITE, designated SEQ ID:37296, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53447] Another function of VGAM1562 is therefore inhibition of ALK7 (Accession XM\_065712). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALK7. DKFZp761F2014 (Accession NM\_020215) is another

VGAM1562 host target gene. DKFZp761F2014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761F2014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761F2014 BINDING SITE, designated SEQ ID:21458, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53448] Another function of VGAM1562 is therefore inhibition of DKFZp761F2014 (Accession NM\_020215). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761F2014. F-box Only Protein 4 (FBXO4, Accession NM\_033484) is another VGAM1562 host target gene. FBXO4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXO4 BINDING SITE, designated SEQ ID:27261, to the nucleotide sequence of VGAM1562 RNA,

herein designated VGAM RNA, also designated SEQ ID:4273.

[53449] Another function of VGAM1562 is therefore inhibition of F-box Only Protein 4 (FBXO4, Accession NM\_033484). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXO4. FLJ10619 (Accession NM\_018156) is another VGAM1562 host target gene. FLJ10619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10619 BINDING SITE, designated SEQ ID:19967, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53450] Another function of VGAM1562 is therefore inhibition of FLJ10619 (Accession NM\_018156). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10619. FLJ11210 (Accession XM\_005298) is another VGAM1562 host target gene. FLJ11210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by FLJ11210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11210 BINDING SITE, designated SEQ ID:29974, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53451] Another function of VGAM1562 is therefore inhibition of FLJ11210 (Accession XM\_005298). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11210. FLJ12619 (Accession NM\_030939) is another VGAM1562 host target gene. FLJ12619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12619 BINDING SITE, designated SEQ ID:25210, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53452] Another function of VGAM1562 is therefore inhibition of FLJ12619 (Accession NM\_030939). Accordingly, utilities of

VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12619. FLJ20086 (Accession NM\_017661) is another VGAM1562 host target gene. FLJ20086 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20086 BINDING SITE, designated SEQ ID:19187, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53453] Another function of VGAM1562 is therefore inhibition of FLJ20086 (Accession NM\_017661). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20086. FLJ21916 (Accession NM\_023112) is another VGAM1562 host target gene. FLJ21916 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21916, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21916

BINDING SITE, designated SEQ ID:23385, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53454] Another function of VGAM1562 is therefore inhibition of FLJ21916 (Accession NM\_023112). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21916. FLJ23511 (Accession NM\_032239) is another VGAM1562 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25962, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53455] Another function of VGAM1562 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. HSAJ1454 (Accession NM\_016950) is another VGAM1562 host target gene. HSAJ1454 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSAJ1454, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSAJ1454 BINDING SITE, designated SEQ ID:18866, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53456] Another function of VGAM1562 is therefore inhibition of HSAJ1454 (Accession NM\_016950). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSAJ1454. KIAA0992 (Accession NM\_016081) is another VGAM1562 host target gene. KIAA0992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0992 BINDING SITE, designated SEQ ID:18156, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53457] Another function of VGAM1562 is therefore inhibition of

KIAA0992 (Accession NM\_016081). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0992. KIAA1323 (Accession XM\_032146) is another VGAM1562 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:31562, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53458] Another function of VGAM1562 is therefore inhibition of KIAA1323 (Accession XM\_032146). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM\_027943) is another VGAM1562 host target gene. RASGRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASGRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASGRF2 BINDING SITE, designated SEQ ID:30597, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53459] Another function of VGAM1562 is therefore inhibition of Ras Protein-specific Guanine Nucleotide-releasing Factor 2 (RASGRF2, Accession XM\_027943). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASGRF2. SAM Domain, SH3 Domain and Nuclear Localisation Signals, 1 (SAMSN1, Accession NM\_022136) is another VGAM1562 host target gene. SAMSN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SAMSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMSN1 BINDING SITE, designated SEQ ID:22696, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53460] Another function of VGAM1562 is therefore inhibition of SAM Domain, SH3 Domain and Nuclear Localisation Sig-

nals, 1 (SAMSN1, Accession NM\_022136). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMSN1. STIP-1 (Accession XM\_045694) is another VGAM1562 host target gene. STIP-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STIP-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIP-1 BINDING SITE, designated SEQ ID:34526, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53461] Another function of VGAM1562 is therefore inhibition of STIP-1 (Accession XM\_045694). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIP-1. TA-KRP (Accession NM\_032505) is another VGAM1562 host target gene. TA-KRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TA-KRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of TA-KRP BINDING SITE, designated SEQ ID:26252, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53462] Another function of VGAM1562 is therefore inhibition of TA-KRP (Accession NM\_032505). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-KRP. T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454) is another VGAM1562 host target gene. TIAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAM2 BINDING SITE, designated SEQ ID:14822, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53463] Another function of VGAM1562 is therefore inhibition of T-cell Lymphoma Invasion and Metastasis 2 (TIAM2, Accession NM\_012454). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with TIAM2. LOC150605 (Accession XM\_097927) is another VGAM1562 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:41228, to the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53464] Another function of VGAM1562 is therefore inhibition of LOC150605 (Accession XM\_097927). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150605. LOC152756 (Accession XM\_098262) is another VGAM1562 host target gene. LOC152756 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:41549, to

the nucleotide sequence of VGAM1562 RNA, herein designated VGAM RNA, also designated SEQ ID:4273.

[53465] Another function of VGAM1562 is therefore inhibition of LOC152756 (Accession XM\_098262). Accordingly, utilities of VGAM1562 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1563 (VGAM1563) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53466] VGAM1563 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1563 was detected is described hereinabove with reference to Figs. 1–8.

[53467] VGAM1563 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bean Common Mosaic Virus. VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53468] VGAM1563 gene encodes a VGAM1563 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1563 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1563 precursor RNA is designated SEQ ID:1549, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1549 is located at position 9514 relative to the genome of Bean Common Mosaic Virus.

[53469] VGAM1563 precursor RNA folds onto itself, forming VGAM1563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53470] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1563 folded precursor RNA into VGAM1563 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM1563 RNA is designated SEQ ID:4274, and is provided hereinbelow with reference to the sequence listing part.

[53471] VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1563 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53472] VGAM1563 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1563 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1563 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53473] The complementary binding of VGAM1563 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1563 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1563 host target RNA into VGAM1563 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53474] It is appreciated that VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1563 host target genes. The mRNA of each one of this plurality of VGAM1563 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1563 RNA, herein designated VGAM RNA, and which when bound by VGAM1563 RNA causes inhibition of translation of respective one or more VGAM1563 host target proteins.

[53475] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1563 gene, herein designated VGAM GENE, on one or more VGAM1563 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[53476] It is yet further appreciated that a function of VGAM1563 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of viral infection by Bean Common Mosaic Virus. Specific functions, and accordingly utilities, of VGAM1563 correlate with, and may be deduced from, the identity of the host target genes which VGAM1563 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53477] Nucleotide sequences of the VGAM1563 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1563 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1563 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1563 are further described hereinbelow with reference to Table 1.

[53478] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1563 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1563 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53479] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1563 gene, herein designated VGAM is inhibition of expression of VGAM1563 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1563 correlate with, and may be deduced from, the identity of the target genes which VGAM1563 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53480] Adrenergic, Alpha-1A-, Receptor (ADRA1A, Accession NM\_000680) is a VGAM1563 host target gene. ADRA1A BINDING SITE1 through ADRA1A BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADRA1A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA1A BINDING SITE1 through ADRA1A BINDING SITE4, designated SEQ ID:6334, SEQ ID:27135, SEQ ID:27136 and SEQ ID:27134 respectively, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ

ID:4274.

[53481] A function of VGAM1563 is therefore inhibition of Adren-  
ergic, Alpha-1A-, Receptor (ADRA1A, Accession  
NM\_000680). Accordingly, utilities of VGAM1563 include  
diagnosis, prevention and treatment of diseases and clinical  
conditions associated with ADRA1A. Hepatocyte  
Growth Factor (hepapoietin A; scatter factor) (HGF, Acces-  
sion XM\_168542) is another VGAM1563 host target gene.  
HGF BINDING SITE is HOST TARGET binding site found in  
the 3' untranslated region of mRNA encoded by HGF, cor-  
responding to a HOST TARGET binding site such as BIND-  
ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-  
lustrates the complementarity of the nucleotide sequences  
of HGF BINDING SITE, designated SEQ ID:45228, to the  
nucleotide sequence of VGAM1563 RNA, herein desig-  
nated VGAM RNA, also designated SEQ ID:4274.

[53482] Another function of VGAM1563 is therefore inhibition of  
Hepatocyte Growth Factor (hepapoietin A; scatter factor)  
(HGF, Accession XM\_168542), a gene which may be re-  
quired for normal embryonic development; strongly simi-  
lar to murine Hgf, has kringle domains. Accordingly, utili-  
ties of VGAM1563 include diagnosis, prevention and  
treatment of diseases and clinical conditions associated

with HGF. The function of HGF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM174. Occludin (OCLN, Accession NM\_002538) is another VGAM1563 host target gene. OCLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OCLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCLN BINDING SITE, designated SEQ ID:8380, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53483] Another function of VGAM1563 is therefore inhibition of Occludin (OCLN, Accession NM\_002538). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCLN. Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM\_012238) is another VGAM1563 host target gene. SIRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIRT1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRT1 BINDING SITE, designated SEQ ID:14543, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53484] Another function of VGAM1563 is therefore inhibition of Sirtuin Silent Mating Type Information Regulation 2 Homolog 1 (*S. cerevisiae*) (SIRT1, Accession NM\_012238), a gene which may function as intracellular regulatory protein with mono-ADP-ribosyltransferase activity. Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRT1. The function of SIRT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM244.CMG2 (Accession NM\_058172) is another VGAM1563 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMG2 BINDING SITE, designated SEQ

ID:27723, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53485] Another function of VGAM1563 is therefore inhibition of CMG2 (Accession NM\_058172). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. DKFZp434F142 (Accession NM\_032254) is another VGAM1563 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25993, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53486] Another function of VGAM1563 is therefore inhibition of DKFZp434F142 (Accession NM\_032254). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142. DKFZp547J036 (Accession

NM\_032281) is another VGAM1563 host target gene. DKFZp547J036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547J036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547J036 BINDING SITE, designated SEQ ID:26041, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53487] Another function of VGAM1563 is therefore inhibition of DKFZp547J036 (Accession NM\_032281). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547J036. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM1563 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28539, to the

nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53488] Another function of VGAM1563 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. KIAA0367 (Accession XM\_041018) is another VGAM1563 host target gene. KIAA0367 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0367, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0367 BINDING SITE, designated SEQ ID:33425, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53489] Another function of VGAM1563 is therefore inhibition of KIAA0367 (Accession XM\_041018). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0367. KIAA0537 (Accession NM\_014840) is another VGAM1563 host target gene. KIAA0537 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0537 BINDING SITE, designated SEQ ID:16866, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53490] Another function of VGAM1563 is therefore inhibition of KIAA0537 (Accession NM\_014840). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. KIAA1713 (Accession XM\_051335) is another VGAM1563 host target gene. KIAA1713 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1713, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1713 BINDING SITE, designated SEQ ID:35811, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53491] Another function of VGAM1563 is therefore inhibition of

KIAA1713 (Accession XM\_051335). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1713. MGC10818 (Accession NM\_030568) is another VGAM1563 host target gene. MGC10818 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10818, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10818 BINDING SITE, designated SEQ ID:24944, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53492] Another function of VGAM1563 is therefore inhibition of MGC10818 (Accession NM\_030568). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10818. PDP (Accession NM\_018444) is another VGAM1563 host target gene. PDP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PDP BINDING SITE, designated SEQ ID:20515, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53493] Another function of VGAM1563 is therefore inhibition of PDP (Accession NM\_018444). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDP. Zinc Finger Protein 323 (ZNF323, Accession NM\_030899) is another VGAM1563 host target gene. ZNF323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF323 BINDING SITE, designated SEQ ID:25171, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53494] Another function of VGAM1563 is therefore inhibition of Zinc Finger Protein 323 (ZNF323, Accession NM\_030899). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF323. LOC146485 (Accession

XM\_007966) is another VGAM1563 host target gene.

LOC146485 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146485 BINDING SITE, designated SEQ ID:30070, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53495] Another function of VGAM1563 is therefore inhibition of LOC146485 (Accession XM\_007966). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146485. LOC153785 (Accession XM\_087763) is another VGAM1563 host target gene. LOC153785 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153785, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153785 BINDING SITE, designated SEQ ID:39409, to the nucleotide sequence of VGAM1563 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4274.

[53496] Another function of VGAM1563 is therefore inhibition of LOC153785 (Accession XM\_087763). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153785. LOC157663 (Accession XM\_088354) is another VGAM1563 host target gene. LOC157663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157663 BINDING SITE, designated SEQ ID:39639, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53497] Another function of VGAM1563 is therefore inhibition of LOC157663 (Accession XM\_088354). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157663. LOC158377 (Accession XM\_098933) is another VGAM1563 host target gene. LOC158377 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158377, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158377 BINDING SITE, designated SEQ ID:41970, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53498] Another function of VGAM1563 is therefore inhibition of LOC158377 (Accession XM\_098933). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158377. LOC169611 (Accession XM\_095809) is another VGAM1563 host target gene. LOC169611 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40288, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53499] Another function of VGAM1563 is therefore inhibition of LOC169611 (Accession XM\_095809). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC169611. LOC93624 (Accession XM\_052624) is another VGAM1563 host target gene. LOC93624 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93624 BINDING SITE, designated SEQ ID:36017, to the nucleotide sequence of VGAM1563 RNA, herein designated VGAM RNA, also designated SEQ ID:4274.

[53500] Another function of VGAM1563 is therefore inhibition of LOC93624 (Accession XM\_052624). Accordingly, utilities of VGAM1563 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93624. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1564 (VGAM1564) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53501] VGAM1564 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1564 was detected is described hereinabove with reference to Figs. 1–8.

[53502] VGAM1564 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53503] VGAM1564 gene encodes a VGAM1564 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1564 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1564 precursor RNA is designated SEQ ID:1550, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1550 is located at position 167115 relative to the genome of Human Herpesvirus 5.

[53504] VGAM1564 precursor RNA folds onto itself, forming VGAM1564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53505] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1564 folded precursor RNA into VGAM1564 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1564 RNA is designated SEQ ID:4275, and is provided hereinbelow with reference to the sequence listing part.

[53506] VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1564 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53507] VGAM1564 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1564 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1564 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53508] The complementary binding of VGAM1564 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1564 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1564 host target RNA into VGAM1564 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53509] It is appreciated that VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1564 host target genes. The mRNA of each one of this plurality of VGAM1564 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1564 RNA, herein designated VGAM RNA, and which when bound by VGAM1564 RNA causes inhibition of translation of respective one or more VGAM1564 host target proteins.

[53510] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1564 gene, herein designated VGAM GENE, on one or more VGAM1564 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53511] It is yet further appreciated that a function of VGAM1564 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1564 correlate with, and may be deduced from, the identity of the host target genes which VGAM1564 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53512] Nucleotide sequences of the VGAM1564 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1564 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1564 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1564 are further described hereinbelow with reference to Table 1.

[53513] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1564 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1564 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53514] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1564 gene, herein designated VGAM is inhibition of expression of VGAM1564 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1564 correlate with, and may be deduced from, the identity of the target genes which VGAM1564 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53515] BMF (Accession NM\_033503) is a VGAM1564 host target gene. BMF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

BMF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:27282, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53516] A function of VGAM1564 is therefore inhibition of BMF (Accession NM\_033503). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF. Chromosome 4 Open Reading Frame 6 (C4orf6, Accession NM\_005750) is another VGAM1564 host target gene. C4orf6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C4orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C4orf6 BINDING SITE, designated SEQ ID:12312, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53517] Another function of VGAM1564 is therefore inhibition of Chromosome 4 Open Reading Frame 6 (C4orf6, Accession

NM\_005750). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf6. DKFZp434F142 (Accession NM\_032254) is another VGAM1564 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25995, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53518] Another function of VGAM1564 is therefore inhibition of DKFZp434F142 (Accession NM\_032254). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142. GRB2-associated Binding Protein 3 (GAB3, Accession NM\_080612) is another VGAM1564 host target gene. GAB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:27930, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53519] Another function of VGAM1564 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM\_080612). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. KIAA0895 (Accession XM\_166573) is another VGAM1564 host target gene. KIAA0895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0895 BINDING SITE, designated SEQ ID:44548, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53520] Another function of VGAM1564 is therefore inhibition of KIAA0895 (Accession XM\_166573). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0895. KIAA1193 (Accession XM\_041843) is another VGAM1564 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33578, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53521] Another function of VGAM1564 is therefore inhibition of KIAA1193 (Accession XM\_041843). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. MGC2560 (Accession NM\_031452) is another VGAM1564 host target gene. MGC2560 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2560 BINDING SITE, designated SEQ ID:25468, to the nucleotide

sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53522] Another function of VGAM1564 is therefore inhibition of MGC2560 (Accession NM\_031452). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2560. LOC145497 (Accession XM\_085150) is another VGAM1564 host target gene. LOC145497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145497 BINDING SITE, designated SEQ ID:37875, to the nucleotide sequence of VGAM1564 RNA, herein designated VGAM RNA, also designated SEQ ID:4275.

[53523] Another function of VGAM1564 is therefore inhibition of LOC145497 (Accession XM\_085150). Accordingly, utilities of VGAM1564 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145497. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1565 (VGAM1565) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53524] VGAM1565 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1565 was detected is described hereinabove with reference to Figs. 1–8.

[53525] VGAM1565 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53526] VGAM1565 gene encodes a VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1565 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1565 precursor RNA is designated SEQ ID:1551, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1551 is located at position 170917 relative to the genome of Human Herpesvirus 5.

[53527] VGAM1565 precursor RNA folds onto itself, forming VGAM1565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53528] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1565 folded precursor RNA into VGAM1565 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1565 RNA is designated SEQ ID:4276, and is provided hereinbelow with reference to the sequence listing part.

[53529] VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1565 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1565 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53530] VGAM1565 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1565 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1565 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53531] The complementary binding of VGAM1565 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1565 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1565 host target RNA into VGAM1565 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53532] It is appreciated that VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1565 host target genes. The mRNA of each one of this plurality of VGAM1565 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1565 RNA, herein designated VGAM RNA, and which when bound by VGAM1565 RNA causes inhibition of translation of respective one or more VGAM1565 host target proteins.

[53533] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1565 gene, herein designated VGAM GENE, on one or more VGAM1565 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53534] It is yet further appreciated that a function of VGAM1565 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1565 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1565 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53535] Nucleotide sequences of the VGAM1565 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1565 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1565 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1565 are further described hereinbelow with reference to Table 1.

[53536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1565 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1565 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53537] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1565 gene, herein designated VGAM is inhibition of expression of VGAM1565 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1565 correlate with, and may be deduced from, the identity of the target genes which VGAM1565

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53538] ATP-binding Cassette, Sub-family F (GCN20), Member 1 (ABCF1, Accession NM\_001090) is a VGAM1565 host target gene. ABCF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCF1 BINDING SITE, designated SEQ ID:6746, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53539] A function of VGAM1565 is therefore inhibition of ATP-binding Cassette, Sub-family F (GCN20), Member 1 (ABCF1, Accession NM\_001090). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCF1. Carbohydrate Kinase-like (CARKL, Accession NM\_013276) is another VGAM1565 host target gene. CARKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARKL, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARKL BINDING SITE, designated SEQ ID:14938, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53540] Another function of VGAM1565 is therefore inhibition of Carbohydrate Kinase-like (CARKL, Accession NM\_013276), a gene which is a putative carbohydrate kinase and may be a modifier for the cystinosis phenotype. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARKL. The function of CARKL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. Cryptochrome 2 (photolyase-like) (CRY2, Accession XM\_051030) is another VGAM1565 host target gene. CRY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRY2 BINDING SITE, designated SEQ ID:35731, to the nucleotide sequence of

VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53541] Another function of VGAM1565 is therefore inhibition of Cryptochrome 2 (photolyase-like) (CRY2, Accession XM\_051030), a gene which has a role in circadian photoreception in mammals. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRY2. The function of CRY2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1223. Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM\_032564) is another VGAM1565 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26292, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53542] Another function of VGAM1565 is therefore inhibition of

Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM\_032564). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004021) is another VGAM1565 host target gene. DMD BINDING SITE1 through DMD BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DMD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMD BINDING SITE1 through DMD BINDING SITE3, designated SEQ ID:10222, SEQ ID:10234 and SEQ ID:10195 respectively, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53543] Another function of VGAM1565 is therefore inhibition of Dystrophin (muscular dystrophy, Duchenne and Becker types) (DMD, Accession NM\_004021), a gene which muscular dystrophy . Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMD. The function of

DMD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM218.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM\_004482) is another VGAM1565 host target gene. GALNT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GALNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT3 BINDING SITE, designated SEQ ID:10802, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53544] Another function of VGAM1565 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM\_004482), a gene which initiates O-glycosylation of serine and threonine residues. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT3. The function of GALNT3 has been es-

established by previous studies. GALNT3 (EC 2.4.1.41) is one of several enzymes that catalyze the reaction  $\text{UDP-GalNAc} + \text{polypeptide-(Ser/Thr)-OH} \rightarrow \text{GalNAc-}\alpha\text{-O-Ser/Thr-polypeptide} + \text{UDP}$ , thereby initiating O-glycosylation of serine and threonine residues on an array of glycoproteins. Bennett et al. (1996) used degenerate PCR to clone human GALNT3 using primers based on the sequences of GALNT1 (OMIM Ref. No. 602273) and GALNT2 (OMIM Ref. No. 602274). GALNT3 encodes a 633-amino acid protein which has a single membrane-spanning region and is highly homologous to GALNT1 and GALNT2. Northern blot analysis showed that GALNT3 is expressed as a 3.6-kb transcript, with highest levels in human pancreas and testis. Bennett et al. (1996) expressed the gene in insect Sf9 cells and showed that GALNT3 does have GalNAc-transferase activity, but with different substrate specificity than GALNT1 or GALNT2. The mouse ortholog of GalNAc-T3 was cloned by Zara et al. (1996). Bennett et al. (1998) found that the GALNT1, GALNT2, and GALNT3 genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries are conserved within the 3 genes. By FISH, Bennett et al. (1998) mapped the GALNT3 gene to human chromosome

2q24-q31.

[53545] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53546] Bennett, E. P.; Hassan, H.; Clausen, H. : cDNA cloning and expression of a novel human UDP-N-acetyl-alpha-D-galactosamine. J. Biol. Chem. 271: 17006-17012, 1996. ; and

[53547] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP-N-acetylgalacto.

[53548] Further studies establishing the function and utilities of GALNT3 are found in John Hopkins OMIM database record ID 601756, and in cited publications numbered 2823-2825 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM\_048390) is another VGAM1565 host target gene. HCFC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HCFC1 BINDING SITE, designated SEQ ID:35158, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53549] Another function of VGAM1565 is therefore inhibition of Host Cell Factor C1 (VP16-accessory protein) (HCFC1, Accession XM\_048390), a gene which is a host cell factor, has a role in cell proliferation and can form a complex with HSV VP16. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCFC1. The function of HCFC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM341.Homeo Box A7 (HOXA7, Accession NM\_006896) is another VGAM1565 host target gene. HOXA7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HOXA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA7 BINDING SITE, designated SEQ ID:13769, to the

nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53550] Another function of VGAM1565 is therefore inhibition of Homeo Box A7 (HOXA7, Accession NM\_006896), a gene which provides cells with specific positional identities on the anterior–posterior axis. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA7. The function of HOXA7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Potassium Voltage–gated Channel, Shaker–related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634) is another VGAM1565 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:30546, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53551] Another function of VGAM1565 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM\_027634), a gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM727. Lamin B Receptor (LBR, Accession XM\_001795) is another VGAM1565 host target gene. LBR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LBR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LBR BINDING SITE, designated SEQ ID:29852, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53552] Another function of VGAM1565 is therefore inhibition of Lamin B Receptor (LBR, Accession XM\_001795). Accordingly, utilities of VGAM1565 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with LBR. LIM Domain Only 7 (LMO7, Accession NM\_015843) is another VGAM1565 host target gene. LMO7 BINDING SITE1 and LMO7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LMO7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE1 and LMO7 BINDING SITE2, designated SEQ ID:17970 and SEQ ID:11827 respectively, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53553] Another function of VGAM1565 is therefore inhibition of LIM Domain Only 7 (LMO7, Accession NM\_015843). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7. Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession XM\_033595) is another VGAM1565 host target gene. RNASE1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNASE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNASE1 BINDING SITE, designated SEQ ID:31945, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53554] Another function of VGAM1565 is therefore inhibition of Ribonuclease, RNase A Family, 1 (pancreatic) (RNASE1, Accession XM\_033595), a gene which is a Pancreatic ribonuclease; a pyrimidine-specific endonuclease that generates 2',3'-cyclic phosphate products. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNASE1. The function of RNASE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210.RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is another VGAM1565 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE,

designated SEQ ID:9889, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53555] Another function of VGAM1565 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754) is another VGAM1565 host target gene. RUNX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RUNX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RUNX1 BINDING SITE, designated SEQ ID:7500, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ

ID:4276.

[53556] Another function of VGAM1565 is therefore inhibition of Runt-related Transcription Factor 1 (acute myeloid leukemia 1; aml1 oncogene) (RUNX1, Accession NM\_001754). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RUNX1. Synuclein, Alpha (non A4 component of amyloid precursor) (SNCA, Accession NM\_000345) is another VGAM1565 host target gene. SNCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNCA BINDING SITE, designated SEQ ID:5896, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53557] Another function of VGAM1565 is therefore inhibition of Synuclein, Alpha (non A4 component of amyloid precursor) (SNCA, Accession NM\_000345). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNCA. Ubiquitin Specific Protease 6 (Tre-2 oncogene)

(USP6, Accession XM\_165948) is another VGAM1565 host target gene. USP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP6 BINDING SITE, designated SEQ ID:43810, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53558] Another function of VGAM1565 is therefore inhibition of Ubiquitin Specific Protease 6 (Tre-2 oncogene) (USP6, Accession XM\_165948), a gene which has an atp-independent isopeptidase activity, cleaving at the carboxyl terminus of the ubiquitin moiety. Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP6. The function of USP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM296. Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049) is another VGAM1565 host target gene.

ALS2CR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALS2CR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALS2CR3 BINDING SITE, designated SEQ ID:17412, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53559] Another function of VGAM1565 is therefore inhibition of Amyotrophic Lateral Sclerosis 2 (juvenile) Chromosome Region, Candidate 3 (ALS2CR3, Accession NM\_015049). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALS2CR3. CD36L2 (Accession NM\_005506) is another VGAM1565 host target gene. CD36L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD36L2 BINDING SITE, designated SEQ ID:12020, to the nucleotide sequence of VGAM1565 RNA,

herein designated VGAM RNA, also designated SEQ ID:4276.

[53560] Another function of VGAM1565 is therefore inhibition of CD36L2 (Accession NM\_005506). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD36L2. Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM\_004734) is another VGAM1565 host target gene. DCAMKL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCAMKL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCAMKL1 BINDING SITE, designated SEQ ID:11117, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53561] Another function of VGAM1565 is therefore inhibition of Doublecortin and CaM Kinase-like 1 (DCAMKL1, Accession NM\_004734). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCAMKL1. FKSG28 (Accession NM\_030929) is another VGAM1565 host target

gene. FKSG28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKSG28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG28 BINDING SITE, designated SEQ ID:25202, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53562] Another function of VGAM1565 is therefore inhibition of FKSG28 (Accession NM\_030929). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG28. KIAA0173 (Accession NM\_014640) is another VGAM1565 host target gene. KIAA0173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0173 BINDING SITE, designated SEQ ID:16041, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53563] Another function of VGAM1565 is therefore inhibition of KIAA0173 (Accession NM\_014640). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0173. KIAA0317 (Accession NM\_014821) is another VGAM1565 host target gene. KIAA0317 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0317 BINDING SITE, designated SEQ ID:16793, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53564] Another function of VGAM1565 is therefore inhibition of KIAA0317 (Accession NM\_014821). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0317. KIAA0663 (Accession NM\_014827) is another VGAM1565 host target gene. KIAA0663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:16813, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53565] Another function of VGAM1565 is therefore inhibition of KIAA0663 (Accession NM\_014827). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA1001 (Accession NM\_014960) is another VGAM1565 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17328, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53566] Another function of VGAM1565 is therefore inhibition of KIAA1001 (Accession NM\_014960). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1001. KIAA1128 (Accession XM\_043596) is another VGAM1565 host target gene. KIAA1128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1128 BINDING SITE, designated SEQ ID:33971, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53567] Another function of VGAM1565 is therefore inhibition of KIAA1128 (Accession XM\_043596). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1128. Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM\_012316) is another VGAM1565 host target gene. KPNA6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KPNA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KPNA6 BINDING SITE, designated SEQ ID:14685, to the nucleotide sequence of

VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53568] Another function of VGAM1565 is therefore inhibition of Karyopherin Alpha 6 (importin alpha 7) (KPNA6, Accession NM\_012316). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KPNA6. Nucleoporin 54kDa (NUP54, Accession XM\_011144) is another VGAM1565 host target gene. NUP54 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP54, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP54 BINDING SITE, designated SEQ ID:30179, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53569] Another function of VGAM1565 is therefore inhibition of Nucleoporin 54kDa (NUP54, Accession XM\_011144). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUP54. Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession

NM\_014452) is another VGAM1565 host target gene. TNFRSF21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF21 BINDING SITE, designated SEQ ID:15803, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53570] Another function of VGAM1565 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 21 (TNFRSF21, Accession NM\_014452). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF21. LOC158527 (Accession XM\_088594) is another VGAM1565 host target gene. LOC158527 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158527 BINDING SITE, designated SEQ ID:39861, to

the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53571] Another function of VGAM1565 is therefore inhibition of LOC158527 (Accession XM\_088594). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158527. LOC162239 (Accession XM\_091439) is another VGAM1565 host target gene. LOC162239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162239 BINDING SITE, designated SEQ ID:40052, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53572] Another function of VGAM1565 is therefore inhibition of LOC162239 (Accession XM\_091439). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162239. LOC220477 (Accession XM\_071675) is another VGAM1565 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:37409, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53573] Another function of VGAM1565 is therefore inhibition of LOC220477 (Accession XM\_071675). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. LOC220573 (Accession XM\_045569) is another VGAM1565 host target gene. LOC220573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220573 BINDING SITE, designated SEQ ID:34484, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53574] Another function of VGAM1565 is therefore inhibition of LOC220573 (Accession XM\_045569). Accordingly, utilities

of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220573. LOC221337 (Accession XM\_166387) is another VGAM1565 host target gene. LOC221337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221337 BINDING SITE, designated SEQ ID:44236, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53575] Another function of VGAM1565 is therefore inhibition of LOC221337 (Accession XM\_166387). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. LOC253019 (Accession XM\_170907) is another VGAM1565 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253019 BINDING SITE, designated SEQ ID:45668, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53576] Another function of VGAM1565 is therefore inhibition of LOC253019 (Accession XM\_170907). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253975 (Accession XM\_171130) is another VGAM1565 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45935, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53577] Another function of VGAM1565 is therefore inhibition of LOC253975 (Accession XM\_171130). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. LOC51279 (Accession NM\_016546) is another VGAM1565 host target gene. LOC51279 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51279, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51279 BINDING SITE, designated SEQ ID:18615, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53578] Another function of VGAM1565 is therefore inhibition of LOC51279 (Accession NM\_016546). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51279. LOC93190 (Accession XM\_049705) is another VGAM1565 host target gene. LOC93190 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC93190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93190 BINDING SITE, designated SEQ ID:35489, to the nucleotide sequence of VGAM1565 RNA, herein designated VGAM RNA, also designated SEQ ID:4276.

[53579] Another function of VGAM1565 is therefore inhibition of

LOC93190 (Accession XM\_049705). Accordingly, utilities of VGAM1565 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1566 (VGAM1566) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53580] VGAM1566 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1566 was detected is described hereinabove with reference to Figs. 1-8.

[53581] VGAM1566 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53582] VGAM1566 gene encodes a VGAM1566 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1566 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1566 precursor RNA is designated SEQ ID:1552, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1552 is located at position 165653 relative to the genome of Human Herpesvirus 5.

- [53583] VGAM1566 precursor RNA folds onto itself, forming VGAM1566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53584] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1566 folded precursor RNA into VGAM1566 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide se-

quence of VGAM1566 RNA is designated SEQ ID:4277, and is provided hereinbelow with reference to the sequence listing part.

[53585] VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1566 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53586] VGAM1566 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1566 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1566 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[53587] The complementary binding of VGAM1566 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1566 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1566 host target RNA into VGAM1566 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53588] It is appreciated that VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1566 host target genes. The mRNA of each one of this plurality of VGAM1566 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1566 RNA, herein designated VGAM RNA, and which when bound by VGAM1566 RNA causes inhibition of translation of respective one or more VGAM1566 host target proteins.

[53589] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1566 gene, herein designated VGAM GENE, on one or more VGAM1566 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53590] It is yet further appreciated that a function of VGAM1566

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1566 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1566 correlate with, and may be deduced from, the identity of the host target genes which VGAM1566 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53591] Nucleotide sequences of the VGAM1566 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1566 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1566 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1566 are further described hereinbelow with reference to Table 1.

[53592] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1566 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1566 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53593] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1566 gene, herein designated VGAM is inhibition of expression of VGAM1566 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1566 correlate with, and may be deduced from, the identity of the target genes which VGAM1566 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53594] Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM\_054027) is a VGAM1566 host target gene. ANKH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANKH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANKH BINDING SITE, designated SEQ ID:27636, to the nucleotide sequence of VGAM1566 RNA, herein designated VGAM RNA, also designated SEQ ID:4277.

[53595] A function of VGAM1566 is therefore inhibition of Ankylosis, Progressive Homolog (mouse) (ANKH, Accession NM\_054027), a gene which regulates intra- and extracellular levels of inorganic pyrophosphate (ppi), probably functioning as ppi transporter. Accordingly, utilities of

VGAM1566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANKH. The function of ANKH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1247. Sialic Acid Binding Ig-like Lectin 6 (SIGLEC6, Accession XM\_009378) is another VGAM1566 host target gene. SIGLEC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIGLEC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIGLEC6 BINDING SITE, designated SEQ ID:30109, to the nucleotide sequence of VGAM1566 RNA, herein designated VGAM RNA, also designated SEQ ID:4277.

[53596] Another function of VGAM1566 is therefore inhibition of Sialic Acid Binding Ig-like Lectin 6 (SIGLEC6, Accession XM\_009378), a gene which is a cell adhesion molecule for postnatal neural development. Accordingly, utilities of VGAM1566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIGLEC6. The function of SIGLEC6 has been established by

previous studies. Molecules belonging to the immunoglobulin (Ig) superfamily function as mediators of cell-cell interactions. The sialoadhesin family, a group of sialic acid-binding proteins, is a subgroup of the Ig superfamily. Members of the sialoadhesin family include myeloid antigen CD33 (OMIM Ref. No. 159590). By sequencing cDNAs randomly selected from a human placenta cDNA library, Takei et al. (1997) identified a partial cDNA with high sequence similarity to CD33. Using the partial cDNA, they isolated full-length placenta cDNAs. Since the predicted protein had significant similarity to CD33, they called the corresponding gene 'CD33 antigen-like' (CD33L). The deduced 442-amino acid CD33L protein contains a signal peptide, an N-terminal Ig-like V-domain, and 2 adjacent Ig C2-like domains, followed by a transmembrane region and a cytoplasmic tail. Based on its predicted structure, the authors stated that CD33L belongs to the Ig superfamily and is likely a novel member of the sialoadhesin subfamily. Takei et al. (1997) also isolated a cDNA likely representing an alternatively spliced CD33L transcript; they called this transcript CD33L2 and the aforementioned transcript CD33L1. Compared to the original cDNA, this cDNA contains a 176-bp deletion in

the coding sequence, resulting in a predicted 342–amino acid protein lacking the transmembrane and cytoplasmic regions. By RT–PCR of placenta RNA, the authors detected both transcripts, although the transcript encoding the membrane–bound isoform, CD33L1, was considerably more abundant. Northern blot analysis of 16 adult tissues and 4 fetal tissues detected CD33L expression only in the placenta; transcripts of 4 distinct sizes were found, including 1 that was differentially polyadenylated. Using an expression cloning strategy to identify molecules that bind to leptin (OMIM Ref. No. 164160), Patel et al. (1999) isolated a human erythroleukemic cell line cDNA encoding OBBP1. They stated that OBBP1 is identical to CD33L (Takei et al., 1997). The deduced 441–amino acid OBBP1 protein shares 63% and 59% sequence identity with CD33 and OBBP2 (SIGLEC5; 604200), respectively. All 3 of these proteins have a cytoplasmic domain containing putative sites of tyrosine phosphorylation, including an immunoreceptor tyrosine kinase inhibitory motif and a motif found in SLAM (OMIM Ref. No. 603492) and SLAM–like proteins. In vitro studies with sialylated ligands indicated that OBBP1 selectively bound to Neu5Ac(alpha)2–6GalNAc(alpha), or sialyl–Tn, allowing its

formal designation as a SIGLEC (sialic acid-binding Ig-like lectin). Recombinant OBBP1 exhibited tight and specific binding to leptin, whereas OBBP2 and CD33 bound weakly to leptin. Northern blot analysis detected high expression of OBBP1 mRNA in placenta, with moderate expression in peripheral blood leukocytes, spleen, and small intestine. Immunohistochemical analysis showed that OBBP1 is highly expressed in the cyto- and syncytiotrophoblasts of the placenta. Flow cytometric analysis on peripheral blood leukocytes found that OBBP1 is almost exclusively expressed on B cells.

[53597] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

to myeloid antigen CD33 and its specific expression in placenta.

[53600] Further studies establishing the function and utilities of SIGLEC6 are found in John Hopkins OMIM database record ID 604405, and in cited publications numbered 707 and 7444 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14596 (Accession NM\_032809) is another VGAM1566 host target gene. FLJ14596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14596 BINDING SITE, designated SEQ ID:26569, to the nucleotide sequence of VGAM1566 RNA, herein designated VGAM RNA, also designated SEQ ID:4277.

[53601] Another function of VGAM1566 is therefore inhibition of FLJ14596 (Accession NM\_032809). Accordingly, utilities of VGAM1566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14596. LOC147276 (Accession XM\_085756) is another VGAM1566 host target gene. LOC147276 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147276 BINDING SITE, designated SEQ ID:38327, to the nucleotide sequence of VGAM1566 RNA, herein designated VGAM RNA, also designated SEQ ID:4277.

[53602] Another function of VGAM1566 is therefore inhibition of LOC147276 (Accession XM\_085756). Accordingly, utilities of VGAM1566 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147276. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1567 (VGAM1567) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53603] VGAM1567 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1567 was detected is described hereinabove with reference to Figs. 1-8.

[53604] VGAM1567 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53605] VGAM1567 gene encodes a VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1567 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1567 precursor RNA is designated SEQ ID:1553, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1553 is located at position 69308 relative to the genome of Human Herpesvirus 5.

[53606] VGAM1567 precursor RNA folds onto itself, forming VGAM1567 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence

of the nucleotide sequence of the second half thereof.

[53607] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1567 folded precursor RNA into VGAM1567 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1567 RNA is designated SEQ ID:4278, and is provided hereinbelow with reference to the sequence listing part.

[53608] VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1567 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53609] VGAM1567 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1567 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1567 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1567 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53610] The complementary binding of VGAM1567 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1567 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE

II and BINDING SITE III, inhibits translation of VGAM1567 host target RNA into VGAM1567 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53611] It is appreciated that VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1567 host target genes. The mRNA of each one of this plurality of VGAM1567 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1567 RNA, herein designated VGAM RNA, and which when bound by VGAM1567 RNA causes inhibition of translation of respective one or more VGAM1567 host target proteins.

[53612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1567 gene, herein designated VGAM GENE, on one or more VGAM1567 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53613] It is yet further appreciated that a function of VGAM1567 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1567 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1567 correlate with, and may be deduced from, the identity of the host target genes which VGAM1567 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53614] Nucleotide sequences of the VGAM1567 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1567 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1567 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM1567 are further described hereinbelow with reference to Table 1.

[53615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1567 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1567 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53616] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1567 gene, herein designated VGAM is inhibition of expression of VGAM1567 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1567 correlate with, and may be deduced from, the identity of the target genes which VGAM1567 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53617] Fibroblast Activation Protein, Alpha (FAP, Accession NM\_004460) is a VGAM1567 host target gene. FAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates

the complementarity of the nucleotide sequences of FAP BINDING SITE, designated SEQ ID:10765, to the nucleotide sequence of VGAM1567 RNA, herein designated VGAM RNA, also designated SEQ ID:4278.

[53618] A function of VGAM1567 is therefore inhibition of Fibroblast Activation Protein, Alpha (FAP, Accession NM\_004460), a gene which may have a role in tissue remodeling during development and wound healing. Accordingly, utilities of VGAM1567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAP. The function of FAP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM927. LOC145739 (Accession XM\_085222) is another VGAM1567 host target gene. LOC145739 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145739 BINDING SITE, designated SEQ ID:37965, to the nucleotide sequence of VGAM1567 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4278.

[53619] Another function of VGAM1567 is therefore inhibition of LOC145739 (Accession XM\_085222). Accordingly, utilities of VGAM1567 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145739. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1568 (VGAM1568) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53620] VGAM1568 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1568 was detected is described hereinabove with reference to Figs. 1–8.

[53621] VGAM1568 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53622] VGAM1568 gene encodes a VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1568 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1568 precursor RNA is designated SEQ ID:1554, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1554 is located at position 61146 relative to the genome of Human Herpesvirus 5.

- [53623] VGAM1568 precursor RNA folds onto itself, forming VGAM1568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53624] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1568 folded precursor RNA into VGAM1568 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1568 RNA is designated SEQ ID:4279, and is provided hereinbelow with reference to the sequence listing part.

[53625] VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1568 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53626] VGAM1568 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1568 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1568 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[53627] The complementary binding of VGAM1568 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1568 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1568 host target RNA into VGAM1568 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53628] It is appreciated that VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1568 host target genes. The mRNA of

each one of this plurality of VGAM1568 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1568 RNA, herein designated VGAM RNA, and which when bound by VGAM1568 RNA causes inhibition of translation of respective one or more VGAM1568 host target proteins.

[53629] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1568 gene, herein designated VGAM GENE, on one or more VGAM1568 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[53630] It is yet further appreciated that a function of VGAM1568 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1568 correlate with, and may be deduced from, the identity of the host target genes which VGAM1568 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53631] Nucleotide sequences of the VGAM1568 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1568 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1568 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1568 are further described hereinbelow with reference to Table 1.

[53632] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1568 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1568 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53633] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1568 gene, herein designated VGAM is inhibition of expression of VGAM1568 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1568 correlate with, and may be deduced from, the identity of the target genes which VGAM1568 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53634] Protein Kinase C and Casein Kinase Substrate In Neurons 1 (PACSIN1, Accession XM\_166424) is a VGAM1568 host target gene. PACSIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PACSIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN1 BINDING SITE, designated SEQ ID:44317, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53635] A function of VGAM1568 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 1

(PACSIN1, Accession XM\_166424). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN1. FLJ22060 (Accession NM\_024612) is another VGAM1568 host target gene. FLJ22060 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22060, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22060 BINDING SITE, designated SEQ ID:23864, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53636] Another function of VGAM1568 is therefore inhibition of FLJ22060 (Accession NM\_024612). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22060. GLP (Accession NM\_018652) is another VGAM1568 host target gene. GLP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of GLP BINDING SITE, designated SEQ ID:20724, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53637] Another function of VGAM1568 is therefore inhibition of GLP (Accession NM\_018652). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLP. GOLGIN-67 (Accession XM\_170772) is another VGAM1568 host target gene. GOLGIN-67 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGIN-67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGIN-67 BINDING SITE, designated SEQ ID:45537, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53638] Another function of VGAM1568 is therefore inhibition of GOLGIN-67 (Accession XM\_170772). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGIN-67. KIAA0855 (Accession NM\_015003) is another

VGAM1568 host target gene. KIAA0855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0855 BINDING SITE, designated SEQ ID:17377, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53639] Another function of VGAM1568 is therefore inhibition of KIAA0855 (Accession NM\_015003). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0855. Zinc Finger Protein 238 (ZNF238, Accession NM\_006352) is another VGAM1568 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:13046, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ

ID:4279.

[53640] Another function of VGAM1568 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM\_006352). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF238. LOC204301 (Accession XM\_115306) is another VGAM1568 host target gene. LOC204301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC204301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204301 BINDING SITE, designated SEQ ID:43095, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53641] Another function of VGAM1568 is therefore inhibition of LOC204301 (Accession XM\_115306). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204301. LOC220534 (Accession XM\_165405) is another VGAM1568 host target gene. LOC220534 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220534 BINDING SITE, designated SEQ ID:43618, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53642] Another function of VGAM1568 is therefore inhibition of LOC220534 (Accession XM\_165405). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220534. LOC220538 (Accession XM\_165407) is another VGAM1568 host target gene. LOC220538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220538 BINDING SITE, designated SEQ ID:43628, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53643] Another function of VGAM1568 is therefore inhibition of LOC220538 (Accession XM\_165407). Accordingly, utilities

of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220538. LOC220963 (Accession XM\_166145) is another VGAM1568 host target gene. LOC220963 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220963, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220963 BINDING SITE, designated SEQ ID:43959, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53644] Another function of VGAM1568 is therefore inhibition of LOC220963 (Accession XM\_166145). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220963. LOC254358 (Accession XM\_170771) is another VGAM1568 host target gene. LOC254358 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254358, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254358 BINDING SITE, designated SEQ ID:45533, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53645] Another function of VGAM1568 is therefore inhibition of LOC254358 (Accession XM\_170771). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254358. LOC257286 (Accession XM\_170549) is another VGAM1568 host target gene. LOC257286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257286 BINDING SITE, designated SEQ ID:45375, to the nucleotide sequence of VGAM1568 RNA, herein designated VGAM RNA, also designated SEQ ID:4279.

[53646] Another function of VGAM1568 is therefore inhibition of LOC257286 (Accession XM\_170549). Accordingly, utilities of VGAM1568 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1569 (VGAM1569) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53647] VGAM1569 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1569 was detected is described hereinabove with reference to Figs. 1–8.

[53648] VGAM1569 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53649] VGAM1569 gene encodes a VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1569 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1569 precursor RNA is designated SEQ ID:1555, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1555 is located at position 66671 relative to the

genome of Human Herpesvirus 5.

[53650] VGAM1569 precursor RNA folds onto itself, forming VGAM1569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53651] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1569 folded precursor RNA into VGAM1569 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM1569 RNA is designated SEQ ID:4280, and is provided hereinbelow with reference to the sequence listing part.

[53652] VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1569 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53653] VGAM1569 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1569 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1569 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53654] The complementary binding of VGAM1569 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1569 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1569 host target RNA into VGAM1569 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53655] It is appreciated that VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1569 host target genes. The mRNA of each one of this plurality of VGAM1569 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1569 RNA, herein designated VGAM RNA, and which when bound by VGAM1569 RNA causes inhibition of translation of respective one or more VGAM1569 host target proteins.

[53656] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1569 gene, herein designated VGAM GENE, on one or more VGAM1569 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53657] It is yet further appreciated that a function of VGAM1569 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1569

correlate with, and may be deduced from, the identity of the host target genes which VGAM1569 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53658] Nucleotide sequences of the VGAM1569 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1569 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1569 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1569 are further described hereinbelow with reference to Table 1.

[53659] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1569 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1569 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53660] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1569 gene, herein designated VGAM is inhibition of expression of VGAM1569 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1569 correlate with, and may be deduced

from, the identity of the target genes which VGAM1569 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53661] MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM\_002376) is a VGAM1569 host target gene. MARK3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MARK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK3 BINDING SITE, designated SEQ ID:8189, to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53662] A function of VGAM1569 is therefore inhibition of MAP/microtubule Affinity-regulating Kinase 3 (MARK3, Accession NM\_002376), a gene which may be involved in cell cycle regulation. Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK3. The function of MARK3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM964.Testis Expressed Sequence 15 (TEX15, Accession NM\_031271) is another VGAM1569 host target gene. TEX15 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEX15 BINDING SITE, designated SEQ ID:25295, to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53663] Another function of VGAM1569 is therefore inhibition of Testis Expressed Sequence 15 (TEX15, Accession NM\_031271). Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEX15. Tumor Protein P63 (TP63, Accession NM\_003722) is another VGAM1569 host target gene. TP63 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TP63, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP63 BINDING SITE, designated SEQ ID:9817,

to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53664] Another function of VGAM1569 is therefore inhibition of Tumor Protein P63 (TP63, Accession NM\_003722). Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP63. G-protein Coupled Receptor 88 (GPR88, Accession NM\_022049) is another VGAM1569 host target gene. GPR88 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR88, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR88 BINDING SITE, designated SEQ ID:22572, to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53665] Another function of VGAM1569 is therefore inhibition of G-protein Coupled Receptor 88 (GPR88, Accession NM\_022049). Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR88. LOC223009 (Accession XM\_170214) is another VGAM1569 host target

gene. LOC223009 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC223009, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC223009 BINDING SITE, designated SEQ ID:45314, to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53666] Another function of VGAM1569 is therefore inhibition of LOC223009 (Accession XM\_170214). Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC223009. LOC254173 (Accession XM\_173022) is another VGAM1569 host target gene. LOC254173 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC254173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254173 BINDING SITE, designated SEQ ID:46288, to the nucleotide sequence of VGAM1569 RNA, herein designated VGAM RNA, also designated SEQ ID:4280.

[53667] Another function of VGAM1569 is therefore inhibition of LOC254173 (Accession XM\_173022). Accordingly, utilities of VGAM1569 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254173. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1570 (VGAM1570) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53668] VGAM1570 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1570 was detected is described hereinabove with reference to Figs. 1–8.

[53669] VGAM1570 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Herpesvirus 5. VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53670] VGAM1570 gene encodes a VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes,

VGAM1570 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1570 precursor RNA is designated SEQ ID:1556, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1556 is located at position 65530 relative to the genome of Human Herpesvirus 5.

[53671] VGAM1570 precursor RNA folds onto itself, forming VGAM1570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53672] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1570 folded precursor RNA into VGAM1570 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 50%) nucleotide sequence of VGAM1570 RNA is designated SEQ ID:4281, and is provided hereinbelow with reference to the sequence listing part.

[53673] VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1570 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[53674] VGAM1570 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1570 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1570 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53675] The complementary binding of VGAM1570 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1570 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1570 host target RNA into VGAM1570 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53676] It is appreciated that VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1570 host target genes. The mRNA of each one of this plurality of VGAM1570 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1570 RNA, herein designated VGAM RNA, and which when bound by VGAM1570 RNA causes inhibition of translation of respective one or more VGAM1570 host target proteins.

[53677] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1570 gene, herein designated VGAM GENE, on one or more VGAM1570 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53678] It is yet further appreciated that a function of VGAM1570 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1570 include diagnosis, prevention and treatment of viral infection by Human Herpesvirus 5. Specific functions, and accordingly utilities, of VGAM1570 correlate with, and may be deduced from, the identity of the host target genes which VGAM1570 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53679] Nucleotide sequences of the VGAM1570 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1570 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1570 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1570 are further described hereinbelow with reference to Table 1.

[53680] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1570 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1570 RNA, herein designated VGAM RNA, are described hereinbelow

with reference to Table 2.

[53681] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1570 gene, herein designated VGAM is inhibition of expression of VGAM1570 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1570 correlate with, and may be deduced from, the identity of the target genes which VGAM1570 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53682] Beta-1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644) is a VGAM1570 host target gene. B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GAT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GAT1 BINDING SITE1 and B3GAT1 BINDING SITE2, designated SEQ ID:20714 and SEQ ID:27626 respectively, to the nucleotide sequence of VGAM1570 RNA, herein designated VGAM RNA, also designated SEQ ID:4281.

[53683] A function of VGAM1570 is therefore inhibition of Beta-

1,3-glucuronyltransferase 1 (glucuronosyltransferase P) (B3GAT1, Accession NM\_018644). Accordingly, utilities of VGAM1570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GAT1. LOC144667 (Accession XM\_096648) is another VGAM1570 host target gene. LOC144667 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:40449, to the nucleotide sequence of VGAM1570 RNA, herein designated VGAM RNA, also designated SEQ ID:4281.

[53684] Another function of VGAM1570 is therefore inhibition of LOC144667 (Accession XM\_096648). Accordingly, utilities of VGAM1570 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1571 (VGAM1571) viral gene, which modulates expression of respective host target genes

thereof, the function and utility of which host target genes is known in the art.

[53685] VGAM1571 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1571 was detected is described hereinabove with reference to Figs. 1–8.

[53686] VGAM1571 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53687] VGAM1571 gene encodes a VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1571 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1571 precursor RNA is designated SEQ ID:1557, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1557 is located at position 4 relative to the genome of Rhopalosiphum Padi Virus.

[53688] VGAM1571 precursor RNA folds onto itself, forming VGAM1571 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53689] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1571 folded precursor RNA into VGAM1571 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1571 RNA is designated SEQ ID:4282, and is provided hereinbelow with reference to the sequence listing part.

[53690] VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1571 host target RNA comprises three regions, as is typical of mRNA of a pro-

tein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53691] VGAM1571 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1571 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1571 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53692] The complementary binding of VGAM1571 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1571 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1571 host target RNA into VGAM1571 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53693] It is appreciated that VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1571 host target genes. The mRNA of each one of this plurality of VGAM1571 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1571 RNA, herein designated VGAM RNA, and which when bound by VGAM1571 RNA causes inhibition of translation of respective one or more VGAM1571 host target proteins.

[53694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM1571 gene, herein designated VGAM GENE, on one or more VGAM1571 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53695] It is yet further appreciated that a function of VGAM1571 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1571 correlate with, and may be deduced from, the identity of the host target genes which VGAM1571 binds and inhibits, and the function of these host target genes, as

elaborated hereinbelow.

[53696] Nucleotide sequences of the VGAM1571 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1571 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1571 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1571 are further described hereinbelow with reference to Table 1.

[53697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1571 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1571 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53698] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1571 gene, herein designated VGAM is inhibition of expression of VGAM1571 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1571 correlate with, and may be deduced from, the identity of the target genes which VGAM1571 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53699] Calmodulin 1 (phosphorylase kinase, delta) (CALM1, Accession NM\_006888) is a VGAM1571 host target gene. CALM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALM1 BINDING SITE, designated SEQ ID:13756, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53700] A function of VGAM1571 is therefore inhibition of Calmodulin 1 (phosphorylase kinase, delta) (CALM1, Accession NM\_006888), a gene which plays roles in growth and the cell cycle as well as in signal transduction and the synthesis and release of neurotransmitters. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALM1. The function of CALM1 has been established by previous studies. Calmodulin is the archetype of the family of calcium-modulated proteins of which nearly 20 members have been found. They are identified by their occurrence in the cytosol or on membranes facing the cy-

tosol and by a high affinity for calcium. Calmodulin contains 149 amino acids and has 4 calcium-binding domains. Its functions include roles in growth and the cell cycle as well as in signal transduction and the synthesis and release of neurotransmitters. To determine how calcium/calmodulin activates calcium/calmodulin-dependent protein kinase I (CAMK1; 604998), Chin et al. (1997) characterized CAMK1 activation by calmodulin mutants with substitutions at hydrophobic residues. They found that CAMK1 activity is dependent on met124 within the C-terminal domain of calmodulin as well as on N-terminal hydrophobic residues of calmodulin.

[53701] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53702] Rhyner, J. A.; Ottiger, M.; Wicki, R.; Greenwood, T. M.; Strehler, E. E. : Structure of the human CALM1 calmodulin gene and identification of two CALM1-related pseudogenes CALM1P1 and CALM1P2. *Europ. J. Biochem.* 225: 71-82, 1994. ; and

[53703] Chin, D.; Winkler, K. E.; Means, A. R. : Characterization of substrate phosphorylation and use of calmodulin mutants to address implications from the enzyme crystal structure

of calmodul.

[53704] Further studies establishing the function and utilities of CALM1 are found in John Hopkins OMIM database record ID 114180, and in cited publications numbered 12573–1258 and 2 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibronectin Leucine Rich Transmembrane Protein 3 (FLRT3, Accession NM\_013281) is another VGAM1571 host target gene. FLRT3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLRT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT3 BINDING SITE, designated SEQ ID:14948, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53705] Another function of VGAM1571 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 3 (FLRT3, Accession NM\_013281). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT3. Phosphoinositide-3-kinase, Regulatory Subunit, Polypep-

ptide 2 (p85 beta) (PIK3R2, Accession NM\_005027) is another VGAM1571 host target gene. PIK3R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIK3R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIK3R2 BINDING SITE, designated SEQ ID:11468, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53706] Another function of VGAM1571 is therefore inhibition of Phosphoinositide-3-kinase, Regulatory Subunit, Polypeptide 2 (p85 beta) (PIK3R2, Accession NM\_005027), a gene which acts as an adapter and is regulatory subunit (p85 beta) of phosphatidylinositol 3-kinase. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIK3R2. The function of PIK3R2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM647. Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM\_006258) is another VGAM1571 host target gene. PRKG1 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG1 BINDING SITE, designated SEQ ID:12938, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53707] Another function of VGAM1571 is therefore inhibition of Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM\_006258), a gene which relaxes vascular smooth muscle and inhibits platelet aggregation. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG1. The function of PRKG1 has been established by previous studies. Cyclic GMP and cyclic GMP-dependent protein kinase play important roles in physiologic processes such as relaxation of vascular smooth muscle and inhibition of platelet aggregation. Two main forms of cGK have been identified: a soluble form designated type I and an intrinsic membrane-bound form designated type II. Sandberg et al. (1989) isolated and characterized cDNA clones for the type I beta isozyme from human placenta

libraries. The same group used a genomic probe for mapping the gene (Orstavik et al., 1992). By Southern blots of human/hamster somatic cell hybrids, they localized the PRKGR1B gene to chromosome 10. The gene was regionally localized to 10q11.2 by in situ hybridization. Tamura et al. (1996) cloned a human cGKI- $\alpha$  cDNA by RT-PCR of aorta RNA using primers based on the sequence of a bovine cGKI- $\alpha$  cDNA. The predicted 671-amino acid human cGKI- $\alpha$  protein is nearly identical to bovine cGKI- $\alpha$ . Based on Southern blot and sequence analyses, Tamura et al. (1996) suggested that cGKI- $\alpha$  and cGKI- $\beta$  are generated by alternative splicing of a single gene that maps to chromosome 10. By Northern blot analysis, cGKI- $\alpha$  was abundantly expressed as a 7.0-kb mRNA in aorta, heart, kidneys and adrenals; the 7.0-kb cGKI- $\beta$  mRNA was abundantly expressed only in the uterus. Orstavik et al. (1997) noted that type I cGK is a homodimer, with each monomer containing a regulatory cGMP-binding domain and a catalytic domain. They reported that the type I cGK gene consists of 19 exons spanning at least 220 kb. The first 2 exons, which the authors called 1- $\alpha$  and 1- $\beta$ , are used alternatively and encode the  $\alpha$  isoform- and  $\beta$  isoform-specific

sequences. By Northern blot analysis, type I cGK- $\alpha$  mRNA was most abundant in lung and placenta, while type I cGK- $\beta$  was expressed at highest levels in bladder, uterus, adrenal gland, and fallopian tube. Orstavik et al. (1997) noted that 5 of the 7 splice sites in the *Drosophila melanogaster* DG2 gene, which encodes a cGK, are also present in the human type I cGK gene. Osborne et al. (1997) reported that levels of the DG2-encoded cGK in *Drosophila* affect food-search behavior and account for a naturally occurring behavioral polymorphism. Animal model experiments lend further support to the function of PRKG1. Pfeifer et al. (1998) generated mice deficient in cGKI by targeted disruption. Loss of cGKI abolished nitric oxide/cGMP-dependent relaxation of smooth muscle, resulting in severe vascular and intestinal dysfunction. However, cGKI-deficient smooth muscle responded normally to cAMP, indicating that cAMP and cGMP signal via independent pathways, with cGKI being the specific mediator of the nitric oxide/cGMP effects in murine smooth muscle.

[53708] It is appreciated that the abovementioned animal model for PRKG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[53709] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53710] Pfeifer, A.; Klatt, P.; Massberg, S.; Ny, L.; Sausbier, M.; Hirneill, C.; Wang, G.-X.; Korth, M.; Aszodi, A.; Andersson, K.-E.; Krombach, F.; Mayerhofer, A.; Ruth, P.; Fassler, R.; Hofmann, F. : Defective smooth muscle regulation in cGMP kinase I-deficient mice. EMBO J. 17: 3045-3051, 1998. ; and

[53711] Sandberg, M.; Natarajan, V.; Ronander, I.; Kalderon, D.; Walter, U.; Lohmann, S. M.; Jahnsen, T. : Molecular cloning and predicted full-length amino acid sequence of the type I beta isoz.

[53712] Further studies establishing the function and utilities of PRKG1 are found in John Hopkins OMIM database record ID 176894, and in cited publications numbered 1148-1153 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB23, Member RAS Oncogene Family (RAB23, Accession NM\_016277) is another VGAM1571 host target gene. RAB23 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB23, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB23 BINDING SITE, designated SEQ ID:18402, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53713] Another function of VGAM1571 is therefore inhibition of RAB23, Member RAS Oncogene Family (RAB23, Accession NM\_016277), a gene which is involved in the regulation of intracellular membrane trafficking. Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB23. The function of RAB23 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331) is another VGAM1571 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING

SITE, designated SEQ ID:23636, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53714] Another function of VGAM1571 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. FLJ22021 (Accession NM\_024535) is another VGAM1571 host target gene. FLJ22021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22021 BINDING SITE, designated SEQ ID:23746, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53715] Another function of VGAM1571 is therefore inhibition of FLJ22021 (Accession NM\_024535). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22021. KIAA0265 (Accession XM\_045954) is another

VGAM1571 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34630, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53716] Another function of VGAM1571 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA1483 (Accession XM\_045920) is another VGAM1571 host target gene. KIAA1483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1483 BINDING SITE, designated SEQ ID:34616, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53717] Another function of VGAM1571 is therefore inhibition of KIAA1483 (Accession XM\_045920). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1483. KIAA1795 (Accession XM\_050988) is another VGAM1571 host target gene. KIAA1795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1795 BINDING SITE, designated SEQ ID:35700, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53718] Another function of VGAM1571 is therefore inhibition of KIAA1795 (Accession XM\_050988). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1795. MGC13061 (Accession NM\_032322) is another VGAM1571 host target gene. MGC13061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13061, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13061 BINDING SITE, designated SEQ ID:26131, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53719] Another function of VGAM1571 is therefore inhibition of MGC13061 (Accession NM\_032322). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13061. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450) is another VGAM1571 host target gene. SMARCF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMARCF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCF1 BINDING SITE, designated SEQ ID:20524, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53720] Another function of VGAM1571 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent

Regulator of Chromatin, Subfamily F, Member 1 (SMARCF1, Accession NM\_018450). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCF1. Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM\_012460) is another VGAM1571 host target gene. TIMM9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIMM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM9 BINDING SITE, designated SEQ ID:14833, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53721] Another function of VGAM1571 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM\_012460). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM9. LOC143308 (Accession XM\_096411) is another VGAM1571 host target gene. LOC143308 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC143308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:40348, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53722] Another function of VGAM1571 is therefore inhibition of LOC143308 (Accession XM\_096411). Accordingly, utilities of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308. LOC51619 (Accession NM\_015983) is another VGAM1571 host target gene. LOC51619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51619 BINDING SITE, designated SEQ ID:18078, to the nucleotide sequence of VGAM1571 RNA, herein designated VGAM RNA, also designated SEQ ID:4282.

[53723] Another function of VGAM1571 is therefore inhibition of LOC51619 (Accession NM\_015983). Accordingly, utilities

of VGAM1571 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51619. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1572 (VGAM1572) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53724] VGAM1572 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1572 was detected is described hereinabove with reference to Figs. 1-8.

[53725] VGAM1572 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53726] VGAM1572 gene encodes a VGAM1572 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1572 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1572 precursor RNA is designated SEQ ID:1558, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1558 is located at position 3435 relative to the genome of Rhopalosiphum Padi Virus.

[53727] VGAM1572 precursor RNA folds onto itself, forming VGAM1572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53728] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1572 folded precursor RNA into VGAM1572 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1572 RNA is designated SEQ ID:4283, and

is provided hereinbelow with reference to the sequence listing part.

[53729] VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1572 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53730] VGAM1572 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1572 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1572 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53731] The complementary binding of VGAM1572 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1572 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1572 host target RNA into VGAM1572 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53732] It is appreciated that VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1572 host target genes. The mRNA of each one of this plurality of VGAM1572 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1572 RNA, herein designated VGAM RNA, and which when bound by VGAM1572 RNA causes inhibition of translation of respective one or more VGAM1572 host target proteins.

[53733] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1572 gene, herein designated VGAM GENE, on one or more VGAM1572 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53734] It is yet further appreciated that a function of VGAM1572 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1572 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1572 correlate with, and may be deduced from, the identity of the host target genes which VGAM1572 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53735] Nucleotide sequences of the VGAM1572 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1572 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1572 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1572 are further described hereinbelow with reference to Table 1.

[53736] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1572 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1572 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53737] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1572 gene, herein designated VGAM is inhibition of expression of VGAM1572 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1572 correlate with, and may be deduced from, the identity of the target genes which VGAM1572 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53738] FLJ13052 (Accession NM\_023018) is a VGAM1572 host target gene. FLJ13052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13052 BINDING SITE, designated SEQ ID:23285, to the nucleotide sequence of VGAM1572 RNA, herein designated VGAM RNA, also designated SEQ ID:4283.

[53739] A function of VGAM1572 is therefore inhibition of FLJ13052 (Accession NM\_023018). Accordingly, utilities of VGAM1572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13052. KIAA0976 (Accession NM\_014917) is another VGAM1572 host target gene. KIAA0976 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0976 BINDING SITE, designated SEQ ID:17161, to the nucleotide sequence of VGAM1572 RNA, herein designated VGAM RNA, also designated SEQ ID:4283.

[53740] Another function of VGAM1572 is therefore inhibition of KIAA0976 (Accession NM\_014917). Accordingly, utilities of VGAM1572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0976. KIAA1387 (Accession XM\_048092) is another VGAM1572 host target gene. KIAA1387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1387 BINDING SITE, designated SEQ ID:35104, to the nucleotide sequence of VGAM1572 RNA, herein designated VGAM RNA, also designated SEQ ID:4283.

[53741] Another function of VGAM1572 is therefore inhibition of

KIAA1387 (Accession XM\_048092). Accordingly, utilities of VGAM1572 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1387. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1573 (VGAM1573) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53742] VGAM1573 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1573 was detected is described hereinabove with reference to Figs. 1-8.

[53743] VGAM1573 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53744] VGAM1573 gene encodes a VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1573 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1573 precursor RNA is designated SEQ ID:1559, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1559 is located at position 3711 relative to the genome of Rhopalosiphum Padi Virus.

- [53745] VGAM1573 precursor RNA folds onto itself, forming VGAM1573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53746] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1573 folded precursor RNA into VGAM1573 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide se-

quence of VGAM1573 RNA is designated SEQ ID:4284, and is provided hereinbelow with reference to the sequence listing part.

[53747] VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1573 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53748] VGAM1573 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1573 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1573 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[53749] The complementary binding of VGAM1573 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1573 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1573 host target RNA into VGAM1573 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53750] It is appreciated that VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1573 host target genes. The mRNA of each one of this plurality of VGAM1573 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1573 RNA, herein designated VGAM RNA, and which when bound by VGAM1573 RNA causes inhibition of translation of respective one or more VGAM1573 host target proteins.

[53751] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1573 gene, herein designated VGAM GENE, on one or more VGAM1573 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53752] It is yet further appreciated that a function of VGAM1573

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1573 correlate with, and may be deduced from, the identity of the host target genes which VGAM1573 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53753] Nucleotide sequences of the VGAM1573 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1573 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1573 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1573 are further described hereinbelow with reference to Table 1.

[53754] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1573 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1573 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53755] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1573 gene, herein designated VGAM is inhibition of expression of VGAM1573 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1573 correlate with, and may be deduced from, the identity of the target genes which VGAM1573 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53756] Cell Division Cycle 25A (CDC25A, Accession NM\_001789) is a VGAM1573 host target gene. CDC25A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDC25A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC25A BINDING SITE, designated SEQ ID:7540, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53757] A function of VGAM1573 is therefore inhibition of Cell Division Cycle 25A (CDC25A, Accession NM\_001789), a gene which is a tyrosine protein phosphatase required for progression of the cell cycle. Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CDC25A. The function of CDC25A has been established by previous studies. When exposed to ionizing radiation, eukaryotic cells activate checkpoint pathways to delay the progression of the cell cycle. Defects in the ionizing radiation-induced S-phase checkpoint cause 'radioresistant DNA synthesis,' a phenomenon that has been identified in cancer-prone patients suffering from ataxia-telangiectasia. The CDC25A phosphatase activates CDK2, needed for DNA synthesis, but becomes degraded in response to DNA damage or stalled replication. Falck et al. (2001) reported a functional link between ATM (OMIM Ref. No. 208900), checkpoint signaling kinase CHK2 (OMIM Ref. No. 604373), and CDC25A, and implicated this mechanism in controlling the S-phase checkpoint. Falck et al. (2001) showed that ionizing radiation-induced destruction of CDC25A requires both ATM and the CHK2-mediated phosphorylation of CDC25A on serine-123. An ionizing radiation-induced loss of CDC25A protein prevents dephosphorylation of CDK2 and leads to a transient blockade of DNA replication. Falck et al. (2001) also showed that tumor-associated CHK2 alleles cannot bind or phosphorylate CDC25A, and that cells expressing

these CHK2 alleles, elevated CDC25A, or a CDK2 mutant unable to undergo inhibitory phosphorylation (OMIM Ref. No. CDK2AF) fail to inhibit DNA synthesis when irradiated. Falck et al. (2001) concluded that their results support CHK2 as a candidate tumor suppressor, and identify the ATM--CHK2--CDC25A--CDK2 pathway as a genomic integrity checkpoint that prevents radioresistant DNA synthesis. Falck et al. (2002) demonstrated that experimental blockade of either the NBS1 (OMIM Ref. No. 602667)--MRE11 (OMIM Ref. No. 600814) function or the CHK2-triggered events leads to a partial radioresistant DNA synthesis phenotype in human cells. In contrast, concomitant interference with NBS1-MRE11 and the CHK2-CDC25A-CDK2 pathways entirely abolishes inhibition of DNA synthesis induced by ionizing radiation, resulting in complete radioresistant DNA synthesis analogous to that caused by defective ATM. In addition, CDK2-dependent loading of CDC45 (OMIM Ref. No. 603465) onto replication origins, a prerequisite for recruitment of DNA polymerase, was prevented upon irradiation of normal or NBS1/MRE11-defective cells but not cells with defective ATM. Falck et al. (2002) concluded that in response to ionizing radiation, phosphorylation of

NBS1 and CHK2 by ATM triggers 2 parallel branches of the DNA damage–dependent S–phase checkpoint that cooperate by inhibiting distinct steps of DNA replication. To protect genome integrity and ensure survival, eukaryotic cells exposed to genotoxic stress cease proliferating to provide time for DNA repair. Mailand et al. (2000) demonstrated that human cells respond to ultraviolet light or ionizing radiation by rapid, ubiquitin– and proteasome–dependent protein degradation of CDC25A, a phosphatase that is required for progression from G1 to S phase of the cell cycle. This response involved activated CHK1 protein kinase (OMIM Ref. No. 603078) but not the p53 (OMIM Ref. No. 191170) pathway, and the persisting inhibitory tyrosine phosphorylation of CDK2 (OMIM Ref. No. 116953) blocked entry into S phase and DNA replication.

CDC25A–dependent cell cycle arrest occurs 1 to 2 hours after ultraviolet radiation, whereas the p53–p21 axis affects the cell cycle only several hours after ultraviolet treatment. Mailand et al. (2000) thus concluded that the checkpoint response to DNA damage occurs in 2 waves. Overexpression of CDC25A bypassed the mechanism of cell cycle arrest, leading to enhanced DNA damage and decreased cell survival. Mailand et al. (2000) concluded

that the results identified specific degradation of CDC25A as part of the DNA damage checkpoint mechanism and suggested how CDC25A overexpression in human cancers might contribute to tumorigenesis.

[53758] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53759] Mailand, N.; Falck, J.; Lukas, C.; Syljuasen, R. G.; Welcker, M.; Bartek, J.; Lukas, J. : Rapid destruction of human Cdc25A in response to DNA damage. Science 288: 1425–1429, 2000. ; and

[53760] Falck, J.; Mailand, N.; Syljuasen, R. G.; Bartek, J.; Lukas, J. : The ATM–Chk2–Cdc25A checkpoint pathway guards against radioresistant DNA synthesis. Nature 410: 842–847, 2001.

[53761] Further studies establishing the function and utilities of CDC25A are found in John Hopkins OMIM database record ID 116947, and in cited publications numbered 1932–149 and 1933–1935 listed in the bibliography section herein–below, which are also hereby incorporated by reference. GRAF (Accession NM\_015071) is another VGAM1573 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:17442, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53762] Another function of VGAM1573 is therefore inhibition of GRAF (Accession NM\_015071), a gene which is a GTPase activating protein for p21-rac. Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Potassium Voltage-gated Channel, Subfamily H (eag-related), Member 2 (KCNH2, Accession NM\_000238) is another VGAM1573 host target gene. KCNH2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KCNH2 BINDING SITE, designated SEQ ID:5755, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53763] Another function of VGAM1573 is therefore inhibition of Potassium Voltage-gated Channel, Subfamily H (eag-related), Member 2 (KCNH2, Accession NM\_000238), a gene which inwardly rectifying cardiac potassium (ikr) channel. Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNH2. The function of KCNH2 has been established by previous studies. Sanguinetti et al. (1995) expressed the HERG gene in *Xenopus laevis* oocytes and studied the potassium channel's biophysical properties and its sensitivity to various pharmacological agents. Their data indicated that HERG proteins form I(Kr) channels, but that another subunit may be required for certain drug sensitivities. Since block of I(Kr) is a known mechanism for drug-induced cardiac arrhythmias, their findings provided a mechanistic link between certain types of inherited and acquired LQT. Acquired long QT syndrome occurs following treatment with certain medications and in association with reduced serum potassium

levels (hypokalemia). Both acquired and inherited LQTS are associated with torsade de pointes and polymorphic ventricular tachycardia resulting from abnormal cardiac depolarization (as detected by QT prolongation on the electrocardiogram). LQT is also characterized by sinusoidal twisting of the QRS axis around the isoelectric line. Torsade de pointes can degenerate into ventricular fibrillation, which can lead to sudden death Li et al. (1997) identified a subunit interaction domain, termed the NAB domain, in the hydrophilic cytoplasmic N terminus of HERG. This domain is responsible for the oligomerization of the protein into functional tetramers. Truncated HERG proteins, including the deletion mutant at position 1261 (152427.0007), contain the NAB domain but lack the rest of the channel and thus inhibit the expression of functional tetrameric HERG channels in transfected cells. The authors suggested that LQT may be the result of decreased expression of a functional HERG potassium channel in the heart.

[53764] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53765] Priori, S. G.; Napolitano, C.; Schwartz, P. J. : Low pene-

trance in the long QT syndrome: clinical impact. Circulation 99: 529–533, 1999. ; and

[53766] Rajamani, S.; Anderson, C. L.; Anson, B. D.; January, C. T. : Pharmacological rescue of human K<sup>+</sup> channel long-QT2 mutations. Circulation 105: 2830–2835, 2002.

[53767] Further studies establishing the function and utilities of KCNH2 are found in John Hopkins OMIM database record ID 152427, and in cited publications numbered 3435, 354 and 2198–2223 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384) is another VGAM1573 host target gene. DGKD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKD BINDING SITE, designated SEQ ID:29881, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53768] Another function of VGAM1573 is therefore inhibition of Diacylglycerol Kinase, Delta 130kDa (DGKD, Accession XM\_002384). Accordingly, utilities of VGAM1573 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKD. FLJ12484 (Accession XM\_045681) is another VGAM1573 host target gene.

FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FLJ12484, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12484 BINDING SITE1 and FLJ12484 BINDING SITE2, designated SEQ ID:34516 and SEQ ID:23018 respectively, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53769] Another function of VGAM1573 is therefore inhibition of FLJ12484 (Accession XM\_045681). Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12484. MGC1842 (Accession XM\_037797) is another VGAM1573 host target gene. MGC1842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC1842, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC1842 BINDING SITE, designated SEQ ID:32687, to the nucleotide sequence of VGAM1573 RNA, herein designated VGAM RNA, also designated SEQ ID:4284.

[53770] Another function of VGAM1573 is therefore inhibition of MGC1842 (Accession XM\_037797). Accordingly, utilities of VGAM1573 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC1842. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1574 (VGAM1574) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53771] VGAM1574 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1574 was detected is described hereinabove with reference to Figs. 1–8.

[53772] VGAM1574 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[53773] VGAM1574 gene encodes a VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1574 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1574 precursor RNA is designated SEQ ID:1560, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1560 is located at position 7836 relative to the genome of Rhopalosiphum Padi Virus.

[53774] VGAM1574 precursor RNA folds onto itself, forming VGAM1574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53775] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1574 folded precursor RNA into VGAM1574 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1574 RNA is designated SEQ ID:4285, and is provided hereinbelow with reference to the sequence listing part.

[53776] VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1574 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53777] VGAM1574 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1574 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1574 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53778] The complementary binding of VGAM1574 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1574 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1574 host target RNA into VGAM1574 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53779] It is appreciated that VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1574 host target genes. The mRNA of each one of this plurality of VGAM1574 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1574 RNA, herein designated VGAM RNA, and which when bound by VGAM1574 RNA causes inhibition of translation of respective one or more VGAM1574 host target proteins.

[53780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1574 gene, herein designated VGAM GENE, on one or more VGAM1574 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53781] It is yet further appreciated that a function of VGAM1574 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1574 correlate with, and may be deduced from, the identity of the host target genes which VGAM1574 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53782] Nucleotide sequences of the VGAM1574 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1574 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1574 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1574 are further described hereinbelow with reference to Table 1.

[53783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1574 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1574 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53784] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1574 gene, herein designated VGAM is inhibition of expression of VGAM1574 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1574 correlate with, and may be deduced from, the identity of the target genes which VGAM1574 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53785] Dipeptidase 1 (renal) (DPEP1, Accession NM\_004413) is a VGAM1574 host target gene. DPEP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DPEP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPEP1 BINDING SITE, designated SEQ ID:10674, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53786] A function of VGAM1574 is therefore inhibition of Dipeptidase 1 (renal) (DPEP1, Accession NM\_004413), a gene which hydrolyzes a wide range of dipeptides. Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPEP1. The function of DPEP1 has been established by previous studies. Renal dipeptidase, previously referred to as dehydropeptidase I or microsomal dipeptidase (MDP; EC 3.4.13.11), is a kidney membrane enzyme which hydrolyzes a variety of dipeptides and is implicated in the renal metabolism of glutathione and its conjugates, e.g., leukotriene D4 (Kozak and Tate, 1982). RDP is responsible for hydrolysis of the beta-lactam ring of antibiotics such as penem and carbapenem (Campbell et al., 1984). Earlier, beta-lactamase enzymes were thought to occur only in bacteria, where their probable function was in protecting the organisms against the action of beta-lactam antibiotics. These antibiotics exhibit selective toxicity against bacteria but virtual inertness against many eukaryotic cells. Adachi et al. (1990) isolated and characterized cDNA clones for human RDP. DNA and RNA blot analysis indicated the existence of a single gene. By fluorescence in situ hybridization (FISH), Nakagawa et al. (1991) mapped

the RDP gene to 16q24. To isolate potential tumor/growth suppressor genes involved in Wilms tumor, Austruy et al. (1993) constructed a cDNA library by cloning a mature kidney cDNA subtracted with an excess of Wilms tumor mRNA. Clones were selected according to a differential pattern of expression, i.e., positive with RNA from mature kidney and negative with RNA from several Wilms tumors. By comparison of sequences of these clones with the GENBANK database sequences, 1 clone was identified as renal dipeptidase (DPEP1), which had previously been mapped to 16q24 by in situ hybridization. Austruy et al. (1993) used somatic cell hybrids carrying either different human chromosomes or chromosome 16 segments to confirm and refine the physical mapping of DPEP1 to 16q24.3. Two RFLPs were described and used to show linkage of DPEP1 to D16S7; maximum lod score = 5.8 at theta = 0.03.

[53787] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53788] Austruy, E.; Jeanpierre, C.; Antignac, C.; Whitmore, S. A.; Van Cong, N.; Bernheim, A.; Callen, D. F.; Junien, C. : Physical and genetic mapping of the dipeptidase gene

- DPEP1 to 16q24.3. Genomics 15: 684–687, 1993. ; and
- [53789] Nakagawa, H.; Inazawa, J.; Inoue, K.; Misawa, S.; Kashima, K.; Adachi, H.; Nakazato, H.; Abe, T. : Assignment of the human renal dipeptidase gene (DPEP1) to band q24 of chromosome 16. (A.
- [53790] Further studies establishing the function and utilities of DPEP1 are found in John Hopkins OMIM database record ID 179780, and in cited publications numbered 1555–1559 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006) is another VGAM1574 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7733, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.
- [53791] Another function of VGAM1574 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM\_002006), a gene which probably involved in nervous

system development and function. Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF2. The function of FGF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. KIAA0172 (Accession XM\_036295) is another VGAM1574 host target gene. KIAA0172 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0172, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0172 BINDING SITE, designated SEQ ID:32411, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53792] Another function of VGAM1574 is therefore inhibition of KIAA0172 (Accession XM\_036295). Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0172. KIAA0316 (Accession XM\_045712) is another VGAM1574 host target gene. KIAA0316 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0316, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0316 BINDING SITE, designated SEQ ID:34530, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53793] Another function of VGAM1574 is therefore inhibition of KIAA0316 (Accession XM\_045712). Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0316. KIAA0483 (Accession NM\_015176) is another VGAM1574 host target gene. KIAA0483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0483 BINDING SITE, designated SEQ ID:17528, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53794] Another function of VGAM1574 is therefore inhibition of KIAA0483 (Accession NM\_015176). Accordingly, utilities

of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0483. KIAA1538 (Accession XM\_049474) is another VGAM1574 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35425, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53795] Another function of VGAM1574 is therefore inhibition of KIAA1538 (Accession XM\_049474). Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. LOC133088 (Accession XM\_059624) is another VGAM1574 host target gene. LOC133088 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC133088, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC133088 BINDING SITE, designated SEQ ID:37033, to the nucleotide sequence of VGAM1574 RNA, herein designated VGAM RNA, also designated SEQ ID:4285.

[53796] Another function of VGAM1574 is therefore inhibition of LOC133088 (Accession XM\_059624). Accordingly, utilities of VGAM1574 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133088. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1575 (VGAM1575) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53797] VGAM1575 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1575 was detected is described hereinabove with reference to Figs. 1–8.

[53798] VGAM1575 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53799] VGAM1575 gene encodes a VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1575 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1575 precursor RNA is designated SEQ ID:1561, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1561 is located at position 923 relative to the genome of Rhopalosiphum Padi Virus.

[53800] VGAM1575 precursor RNA folds onto itself, forming VGAM1575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53801] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1575 folded precursor RNA into VGAM1575 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM1575 RNA is designated SEQ ID:4286, and is provided hereinbelow with reference to the sequence listing part.

[53802] VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1575 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53803] VGAM1575 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1575 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1575 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53804] The complementary binding of VGAM1575 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1575 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1575 host target RNA into VGAM1575 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53805] It is appreciated that VGAM1575 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1575 host target genes. The mRNA of each one of this plurality of VGAM1575 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1575 RNA, herein designated VGAM RNA, and which when bound by VGAM1575 RNA causes inhibition of translation of respective one or more VGAM1575 host target proteins.

[53806] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1575 gene, herein designated VGAM GENE, on one or more VGAM1575 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[53807] It is yet further appreciated that a function of VGAM1575 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1575 correlate with, and may be deduced from, the identity of the host target genes which VGAM1575 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53808] Nucleotide sequences of the VGAM1575 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1575 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1575 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1575 are further described hereinbelow with reference to Table 1.

[53809] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1575 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1575 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53810] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1575 gene, herein designated VGAM is inhibition of expression of VGAM1575 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1575 correlate with, and may be deduced from, the identity of the target genes which VGAM1575 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53811] FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM\_001447) is a VGAM1575 host target gene. FAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:7173, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53812] A function of VGAM1575 is therefore inhibition of FAT

Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM\_001447), a gene which could function as a cell-adhesion protein. Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2. The function of FAT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM949. Glycosylphosphatidylinositol Specific Phospholipase D1 (GPLD1, Accession XM\_166347) is another VGAM1575 host target gene. GPLD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPLD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPLD1 BINDING SITE, designated SEQ ID:44180, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53813] Another function of VGAM1575 is therefore inhibition of Glycosylphosphatidylinositol Specific Phospholipase D1 (GPLD1, Accession XM\_166347), a gene which hydrolyses the inositol phosphate linkage in proteins anchored by

phosphatidylinositol glycans to release these proteins from the membrane. Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPLD1. The function of GPLD1 has been established by previous studies. Many proteins are attached to the plasma membrane via a glycosylphosphatidylinositol (GPI) anchor. Phosphatidylinositol-glycan (PIG)-specific phospholipases D (PLDs) selectively hydrolyze the inositol phosphate linkage, allowing release of the protein. Scallan et al. (1991) cloned a cDNA encoding a PIGPLD from a bovine liver cDNA library. The deduced amino acid sequence contains 4 regions of internal homology that are similar to the metal ion binding domains of integrin alpha subunits (see OMIM Ref. No. ITGA2, 192974). Bovine PIGPLD does not exhibit phosphatidylcholine-specific PLD (OMIM Ref. No. 602382) activity. By PCR and screening of a human liver cDNA library, Tsang et al. (1992) isolated a cDNA (OMIM Ref. No. L11701) encoding a PIGPLD. The protein product contains 841 amino acids, including a 24-residue signal sequence. Tsang et al. (1992) isolated a cDNA (OMIM Ref. No. L11702) encoding a related but distinct PIGPLD from a human pancreas cDNA library. The pancreas-derived PIG-

PLD contains 840 amino acids, including a 23-residue signal sequence. Schofield and Rademacher (2000) determined that the GPLD1 gene contains 25 exons and spans at least 80 kb. Northern blot analysis revealed expression of 5.8-kb transcript that was restricted to liver. Southern blot analysis indicated that GPLD1 is a single-copy gene.

[53814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[53815] Schofield, J. N.; Rademacher, T. W. : Structure and expression of the human glycosylphosphatidylinositol phospholipase D1 (GPLD1) gene. *Biochim. Biophys. Acta* 1494: 189–194, 2000. ; and

[53816] Tsang, T. C.; Fung, W.-J.; Levine, J.; Metz, C. N.; Davitz, M. A.; Burns, D. K.; Huang, K.-S.; Kochan, J. P. : Isolation and expression of two human glycosylphosphatidylinositol phospho.

[53817] Further studies establishing the function and utilities of GPLD1 are found in John Hopkins OMIM database record ID 602515, and in cited publications numbered 8549–8552 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 4B, CAMP-specific

(phosphodiesterase E4 dunce homolog, *Drosophila*) (PDE4B, Accession NM\_002600) is another VGAM1575 host target gene. PDE4B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:8466, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53818] Another function of VGAM1575 is therefore inhibition of Phosphodiesterase 4B, CAMP-specific (phosphodiesterase E4 dunce homolog, *Drosophila*) (PDE4B, Accession NM\_002600), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti-inflammatory agents. Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B. The function of PDE4B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM51.Chromosome 20 Open Reading Frame 44 (C20orf44, Accession NM\_018244) is another VGAM1575 host target gene. C20orf44 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf44 BINDING SITE, designated SEQ ID:20207, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53819] Another function of VGAM1575 is therefore inhibition of Chromosome 20 Open Reading Frame 44 (C20orf44, Accession NM\_018244). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf44.

FLJ20445 (Accession NM\_017824) is another VGAM1575 host target gene. FLJ20445 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20445 BINDING SITE,

designated SEQ ID:19479, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53820] Another function of VGAM1575 is therefore inhibition of FLJ20445 (Accession NM\_017824). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20445. FLJ21034 (Accession NM\_024940) is another VGAM1575 host target gene. FLJ21034 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21034, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21034 BINDING SITE, designated SEQ ID:24483, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53821] Another function of VGAM1575 is therefore inhibition of FLJ21034 (Accession NM\_024940). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21034. KIAA1272 (Accession XM\_046600) is another VGAM1575 host target gene. KIAA1272 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1272 BINDING SITE, designated SEQ ID:34760, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53822] Another function of VGAM1575 is therefore inhibition of KIAA1272 (Accession XM\_046600). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1272. KIAA1911 (Accession XM\_056302) is another VGAM1575 host target gene. KIAA1911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1911 BINDING SITE, designated SEQ ID:36393, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53823] Another function of VGAM1575 is therefore inhibition of

KIAA1911 (Accession XM\_056302). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1911. NCUBE1 (Accession NM\_016021) is another VGAM1575 host target gene. NCUBE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCUBE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCUBE1 BINDING SITE, designated SEQ ID:18093, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53824] Another function of VGAM1575 is therefore inhibition of NCUBE1 (Accession NM\_016021). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCUBE1. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469) is another VGAM1575 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25529, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53825] Another function of VGAM1575 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. ZIC4 (Accession NM\_032153) is another VGAM1575 host target gene. ZIC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZIC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC4 BINDING SITE, designated SEQ ID:25853, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53826] Another function of VGAM1575 is therefore inhibition of ZIC4 (Accession NM\_032153). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with ZIC4. LOC144017 (Accession XM\_096520) is another VGAM1575 host target gene. LOC144017 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144017 BINDING SITE, designated SEQ ID:40387, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53827] Another function of VGAM1575 is therefore inhibition of LOC144017 (Accession XM\_096520). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144017. LOC201689 (Accession XM\_040608) is another VGAM1575 host target gene. LOC201689 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC201689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201689 BINDING SITE, designated SEQ ID:33334, to

the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53828] Another function of VGAM1575 is therefore inhibition of LOC201689 (Accession XM\_040608). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201689. LOC84549 (Accession NM\_032509) is another VGAM1575 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26260, to the nucleotide sequence of VGAM1575 RNA, herein designated VGAM RNA, also designated SEQ ID:4286.

[53829] Another function of VGAM1575 is therefore inhibition of LOC84549 (Accession NM\_032509). Accordingly, utilities of VGAM1575 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC84549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1576 (VGAM1576) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53830] VGAM1576 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1576 was detected is described hereinabove with reference to Figs. 1–8.

[53831] VGAM1576 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53832] VGAM1576 gene encodes a VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1576 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1576 precursor RNA is designated SEQ ID:1562, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1562 is located at position 3322 relative to the genome of Rhopalosiphum Padi Virus.

[53833] VGAM1576 precursor RNA folds onto itself, forming VGAM1576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53834] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1576 folded precursor RNA into VGAM1576 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM1576 RNA is designated SEQ ID:4287, and is provided hereinbelow with reference to the sequence listing part.

[53835] VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1576 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1576 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[53836] VGAM1576 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1576 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1576 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53837] The complementary binding of VGAM1576 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1576 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1576 host target RNA into VGAM1576 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53838] It is appreciated that VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1576 host target genes. The mRNA of each one of this plurality of VGAM1576 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1576 RNA, herein designated VGAM RNA, and which when bound by VGAM1576 RNA causes inhibition of translation of respective one or more VGAM1576 host target proteins.

[53839] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1576 gene, herein designated VGAM GENE, on one or more VGAM1576 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53840] It is yet further appreciated that a function of VGAM1576 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1576 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1576 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53841] Nucleotide sequences of the VGAM1576 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1576 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1576 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1576 are further described hereinbelow with reference to Table 1.

[53842] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1576 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1576 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53843] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1576 gene, herein designated VGAM is inhibition of expression of VGAM1576 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1576 correlate with, and may be deduced from, the identity of the target genes which VGAM1576

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53844] KIAA1350 (Accession XM\_052597) is a VGAM1576 host target gene. KIAA1350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1350 BINDING SITE, designated SEQ ID:36001, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53845] A function of VGAM1576 is therefore inhibition of KIAA1350 (Accession XM\_052597). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1350. Protocadherin 10 (PCDH10, Accession NM\_020815) is another VGAM1576 host target gene. PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDH10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of PCDH10 BINDING SITE1 and PCDH10 BINDING SITE2, designated SEQ ID:21884 and SEQ ID:26770 respectively, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53846] Another function of VGAM1576 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM\_020815). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. TAF9-like RNA Polymerase II, TATA Box Binding Protein (TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975) is another VGAM1576 host target gene. TAF9L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF9L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF9L BINDING SITE, designated SEQ ID:18073, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53847] Another function of VGAM1576 is therefore inhibition of TAF9-like RNA Polymerase II, TATA Box Binding Protein

(TBP)-associated Factor, 31kDa (TAF9L, Accession NM\_015975). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF9L. Trans-golgi Network Protein 2 (TGOLN2, Accession XM\_034215) is another VGAM1576 host target gene. TGOLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGOLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGOLN2 BINDING SITE, designated SEQ ID:32024, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53848] Another function of VGAM1576 is therefore inhibition of Trans-golgi Network Protein 2 (TGOLN2, Accession XM\_034215). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGOLN2. LOC153364 (Accession XM\_087657) is another VGAM1576 host target gene. LOC153364 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153364, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153364 BINDING SITE, designated SEQ ID:39370, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53849] Another function of VGAM1576 is therefore inhibition of LOC153364 (Accession XM\_087657). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153364. LOC155072 (Accession XM\_098661) is another VGAM1576 host target gene. LOC155072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155072 BINDING SITE, designated SEQ ID:41761, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53850] Another function of VGAM1576 is therefore inhibition of LOC155072 (Accession XM\_098661). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC155072. LOC202868 (Accession XM\_117477) is another VGAM1576 host target gene. LOC202868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC202868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202868 BINDING SITE, designated SEQ ID:43448, to the nucleotide sequence of VGAM1576 RNA, herein designated VGAM RNA, also designated SEQ ID:4287.

[53851] Another function of VGAM1576 is therefore inhibition of LOC202868 (Accession XM\_117477). Accordingly, utilities of VGAM1576 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202868. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1577 (VGAM1577) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53852] VGAM1577 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1577 was detected is described hereinabove with reference to Figs. 1–8.

[53853] VGAM1577 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53854] VGAM1577 gene encodes a VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1577 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1577 precursor RNA is designated SEQ ID:1563, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1563 is located at position 2545 relative to the genome of Rhopalosiphum Padi Virus.

[53855] VGAM1577 precursor RNA folds onto itself, forming VGAM1577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53856] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1577 folded precursor RNA into VGAM1577 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1577 RNA is designated SEQ ID:4288, and is provided hereinbelow with reference to the sequence listing part.

[53857] VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1577 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53858] VGAM1577 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1577 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1577 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53859] The complementary binding of VGAM1577 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1577 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1577 host target RNA into VGAM1577 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53860] It is appreciated that VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1577 host target genes. The mRNA of each one of this plurality of VGAM1577 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1577 RNA, herein designated VGAM RNA, and which when bound by VGAM1577 RNA causes inhibition of translation of respective one or more VGAM1577 host target proteins.

[53861] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1577 gene, herein designated VGAM GENE, on one or more VGAM1577 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53862] It is yet further appreciated that a function of VGAM1577 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1577 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1577 correlate with, and may be deduced from, the identity of the host target genes which VGAM1577 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53863] Nucleotide sequences of the VGAM1577 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1577 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1577 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1577 are further described hereinbelow with reference to Table 1.

[53864] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1577 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1577 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53865] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1577 gene, herein designated VGAM is inhibition of expression of VGAM1577 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1577 correlate with, and may be deduced from, the identity of the target genes which VGAM1577 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53866] Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228) is a VGAM1577 host target

gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11724, to the nucleotide sequence of VGAM1577 RNA, herein designated VGAM RNA, also designated SEQ ID:4288.

[53867] A function of VGAM1577 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM229. Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065) is another VGAM1577 host target gene. GLUL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUL, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUL BINDING SITE, designated SEQ ID:7833, to the nucleotide sequence of VGAM1577 RNA, herein designated VGAM RNA, also designated SEQ ID:4288.

[53868] Another function of VGAM1577 is therefore inhibition of Glutamate-ammonia Ligase (glutamine synthase) (GLUL, Accession NM\_002065), a gene which catalyzes the condensation of glutamate and ammonia to form glutamine. Accordingly, utilities of VGAM1577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUL. The function of GLUL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM948. SMUG1 (Accession NM\_014311) is another VGAM1577 host target gene. SMUG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMUG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMUG1 BINDING SITE, designated SEQ

ID:15608, to the nucleotide sequence of VGAM1577 RNA, herein designated VGAM RNA, also designated SEQ ID:4288.

[53869] Another function of VGAM1577 is therefore inhibition of SMUG1 (Accession NM\_014311). Accordingly, utilities of VGAM1577 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMUG1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1578 (VGAM1578) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53870] VGAM1578 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1578 was detected is described hereinabove with reference to Figs. 1–8.

[53871] VGAM1578 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53872] VGAM1578 gene encodes a VGAM1578 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1578 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1578 precursor RNA is designated SEQ ID:1564, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1564 is located at position 3984 relative to the genome of Rhopalosiphum Padi Virus.

- [53873] VGAM1578 precursor RNA folds onto itself, forming VGAM1578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [53874] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1578 folded precursor RNA into VGAM1578 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1578 RNA is designated SEQ ID:4289, and is provided hereinbelow with reference to the sequence listing part.

[53875] VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1578 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53876] VGAM1578 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1578 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1578 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53877] The complementary binding of VGAM1578 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1578 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1578 host target RNA into VGAM1578 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53878] It is appreciated that VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1578 host target genes. The mRNA of each one of this plurality of VGAM1578 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1578 RNA, herein designated VGAM RNA, and which when bound by VGAM1578 RNA causes inhibition of translation of respective one or more VGAM1578 host target proteins.

[53879] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1578 gene, herein designated VGAM GENE, on one or more VGAM1578 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[53880] It is yet further appreciated that a function of VGAM1578 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1578 correlate with, and may be deduced from, the identity of the host target genes which VGAM1578 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53881] Nucleotide sequences of the VGAM1578 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1578 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1578 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1578 are further described hereinbelow with reference to Table 1.

[53882] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1578 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1578 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53883] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1578 gene, herein designated VGAM is inhibition of expression of VGAM1578 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1578 correlate with, and may be deduced from, the identity of the target genes which VGAM1578 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53884] Cyclin F (CCNF, Accession NM\_001761) is a VGAM1578 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7527, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53885] A function of VGAM1578 is therefore inhibition of Cyclin F (CCNF, Accession NM\_001761), a gene which likely to be

involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF. The function of CCNF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM367. Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082) is another VGAM1578 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5531, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53886] Another function of VGAM1578 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM\_000082). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CKN1. Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession

NM\_000091) is another VGAM1578 host target gene. COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A3 BINDING SITE1 through COL4A3 BINDING SITE3, designated SEQ ID:5549, SEQ ID:25356 and SEQ ID:25362 respectively, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53887] Another function of VGAM1578 is therefore inhibition of Collagen, Type IV, Alpha 3 (Goodpasture antigen) (COL4A3, Accession NM\_000091). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A3. Protocadherin Beta 16 (PCDHB16, Accession NM\_020957) is another VGAM1578 host target gene. PCDHB16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB16 BINDING SITE, designated SEQ ID:21946, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53888] Another function of VGAM1578 is therefore inhibition of Protocadherin Beta 16 (PCDHB16, Accession NM\_020957), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB16. The function of PCDHB16 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM931. Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242) is another VGAM1578 host target gene. TGFB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGFB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGFB2 BINDING SITE, designated SEQ ID:9243, to the nucleotide

sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53889] Another function of VGAM1578 is therefore inhibition of Transforming Growth Factor, Beta Receptor II (70/80kDa) (TGFB2, Accession NM\_003242). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGFB2. Zinc Finger Protein 146 (ZNF146, Accession NM\_007145) is another VGAM1578 host target gene. ZNF146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF146 BINDING SITE, designated SEQ ID:13995, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53890] Another function of VGAM1578 is therefore inhibition of Zinc Finger Protein 146 (ZNF146, Accession NM\_007145), a gene which binds zinc ions, DNA, and heparin. Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with ZNF146. The function of ZNF146 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM192. Angiomotin (AMOT, Accession NM\_133265) is another VGAM1578 host target gene. AMOT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOT BINDING SITE, designated SEQ ID:28415, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53891] Another function of VGAM1578 is therefore inhibition of Angiomotin (AMOT, Accession NM\_133265). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOT. Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM\_018270) is another VGAM1578 host target gene. C20orf20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf20, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf20 BINDING SITE, designated SEQ ID:20246, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53892] Another function of VGAM1578 is therefore inhibition of Chromosome 20 Open Reading Frame 20 (C20orf20, Accession NM\_018270). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf20. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989) is another VGAM1578 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:15171 and SEQ ID:6460 respectively, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53893] Another function of VGAM1578 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. FLJ10120 (Accession NM\_018001) is another VGAM1578 host target gene. FLJ10120 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10120, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10120 BINDING SITE, designated SEQ ID:19730, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53894] Another function of VGAM1578 is therefore inhibition of FLJ10120 (Accession NM\_018001). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10120. FLJ11722 (Accession NM\_024970) is another VGAM1578 host target gene. FLJ11722 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11722, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11722 BINDING SITE, designated SEQ ID:24522, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53895] Another function of VGAM1578 is therefore inhibition of FLJ11722 (Accession NM\_024970). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11722. Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Accession NM\_004516) is another VGAM1578 host target gene. ILF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ILF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ILF3 BINDING SITE, designated SEQ ID:10846, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53896] Another function of VGAM1578 is therefore inhibition of Interleukin Enhancer Binding Factor 3, 90kDa (ILF3, Ac-

cession NM\_004516). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ILF3. KIAA1005 (Accession XM\_051197) is another VGAM1578 host target gene. KIAA1005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1005 BINDING SITE, designated SEQ ID:35777, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53897] Another function of VGAM1578 is therefore inhibition of KIAA1005 (Accession XM\_051197). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1005. KIAA1924 (Accession XM\_057091) is another VGAM1578 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36480, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53898] Another function of VGAM1578 is therefore inhibition of KIAA1924 (Accession XM\_057091). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1924. LOC150005 (Accession XM\_097795) is another VGAM1578 host target gene. LOC150005 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150005, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150005 BINDING SITE, designated SEQ ID:41123, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53899] Another function of VGAM1578 is therefore inhibition of LOC150005 (Accession XM\_097795). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150005. LOC255231 (Accession XM\_170908) is an-

other VGAM1578 host target gene. LOC255231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255231 BINDING SITE, designated SEQ ID:45674, to the nucleotide sequence of VGAM1578 RNA, herein designated VGAM RNA, also designated SEQ ID:4289.

[53900] Another function of VGAM1578 is therefore inhibition of LOC255231 (Accession XM\_170908). Accordingly, utilities of VGAM1578 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1579 (VGAM1579) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53901] VGAM1579 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1579 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[53902] VGAM1579 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53903] VGAM1579 gene encodes a VGAM1579 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1579 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1579 precursor RNA is designated SEQ ID:1565, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1565 is located at position 8880 relative to the genome of Rhopalosiphum Padi Virus.

[53904] VGAM1579 precursor RNA folds onto itself, forming VGAM1579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53905] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1579 folded precursor RNA into VGAM1579 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1579 RNA is designated SEQ ID:4290, and is provided hereinbelow with reference to the sequence listing part.

[53906] VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1579 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53907] VGAM1579 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1579 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1579 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1579 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53908] The complementary binding of VGAM1579 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1579 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1579 host target RNA into VGAM1579 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53909] It is appreciated that VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1579 host target genes. The mRNA of each one of this plurality of VGAM1579 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1579 RNA, herein designated VGAM RNA, and which when bound by VGAM1579 RNA causes inhibition of translation of respective one or more VGAM1579 host target proteins.

[53910] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1579 gene, herein designated VGAM GENE, on one or more VGAM1579 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53911] It is yet further appreciated that a function of VGAM1579 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1579 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus. Specific functions, and accordingly utilities, of VGAM1579 correlate with, and may be deduced from, the identity of the host target genes which VGAM1579 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53912] Nucleotide sequences of the VGAM1579 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1579 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1579 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1579 are further described hereinbelow with reference to Table 1.

[53913] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1579 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1579 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53914] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1579 gene, herein designated VGAM is inhibition of expression of VGAM1579 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1579 correlate with, and may be deduced from, the identity of the target genes which VGAM1579 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53915] MFN1 (Accession NM\_017927) is a VGAM1579 host target gene. MFN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MFN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of MFN1 BINDING SITE, designated SEQ ID:19601, to the nucleotide sequence of VGAM1579 RNA, herein designated VGAM RNA, also designated SEQ ID:4290.

[53916] A function of VGAM1579 is therefore inhibition of MFN1 (Accession NM\_017927). Accordingly, utilities of VGAM1579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MFN1. LOC148764 (Accession XM\_086307) is another VGAM1579 host target gene. LOC148764 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148764, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148764 BINDING SITE, designated SEQ ID:38588, to the nucleotide sequence of VGAM1579 RNA, herein designated VGAM RNA, also designated SEQ ID:4290.

[53917] Another function of VGAM1579 is therefore inhibition of LOC148764 (Accession XM\_086307). Accordingly, utilities of VGAM1579 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148764. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1580 (VGAM1580) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53918] VGAM1580 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1580 was detected is described hereinabove with reference to Figs. 1–8.

[53919] VGAM1580 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rhopalosiphum Padi Virus. VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53920] VGAM1580 gene encodes a VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1580 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1580 precursor RNA is designated SEQ ID:1566, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1566 is located at position 8018 relative to the genome of Rhopalosiphum Padi Virus.

[53921] VGAM1580 precursor RNA folds onto itself, forming VGAM1580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53922] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1580 folded precursor RNA into VGAM1580 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1580 RNA is designated SEQ ID:4291, and is provided hereinbelow with reference to the sequence listing part.

[53923] VGAM1580 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1580 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53924] VGAM1580 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1580 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1580 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1580 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[53925] The complementary binding of VGAM1580 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1580 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1580 host target RNA into VGAM1580 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53926] It is appreciated that VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1580 host target genes. The mRNA of each one of this plurality of VGAM1580 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1580 RNA, herein designated VGAM RNA, and which when bound by VGAM1580 RNA causes inhibition of translation of respective one or more

VGAM1580 host target proteins.

[53927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1580 gene, herein designated VGAM GENE, on one or more VGAM1580 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53928] It is yet further appreciated that a function of VGAM1580 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of viral infection by Rhopalosiphum Padi Virus.

Specific functions, and accordingly utilities, of VGAM1580 correlate with, and may be deduced from, the identity of the host target genes which VGAM1580 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53929] Nucleotide sequences of the VGAM1580 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1580 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1580 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1580 are further described hereinbelow with reference to Table 1.

[53930] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1580 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1580 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53931] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1580 gene, herein designated VGAM is inhibition of expression of VGAM1580 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1580 correlate with, and may be deduced from, the identity of the target genes which VGAM1580 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53932] Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817) is a VGAM1580 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23088, to the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, also designated SEQ ID:4291.

[53933] A function of VGAM1580 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM\_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with

reference to VGAM74.AKL3L (Accession NM\_016282) is another VGAM1580 host target gene. AKL3L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKL3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKL3L BINDING SITE, designated SEQ ID:18410, to the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, also designated SEQ ID:4291.

[53934] Another function of VGAM1580 is therefore inhibition of AKL3L (Accession NM\_016282). Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKL3L. FLJ20793 (Accession XM\_166296) is another VGAM1580 host target gene. FLJ20793 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20793, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20793 BINDING SITE, designated SEQ ID:44110, to the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4291.

[53935] Another function of VGAM1580 is therefore inhibition of FLJ20793 (Accession XM\_166296). Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20793. KIAA1715 (Accession XM\_042834) is another VGAM1580 host target gene. KIAA1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1715 BINDING SITE, designated SEQ ID:33794, to the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, also designated SEQ ID:4291.

[53936] Another function of VGAM1580 is therefore inhibition of KIAA1715 (Accession XM\_042834). Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1715. Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM\_130842) is another VGAM1580 host target gene. PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2 are HOST TARGET binding

sites found in untranslated regions of mRNA encoded by PTPRN2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRN2 BINDING SITE1 and PTPRN2 BINDING SITE2, designated SEQ ID:28370 and SEQ ID:28375 respectively, to the nucleotide sequence of VGAM1580 RNA, herein designated VGAM RNA, also designated SEQ ID:4291.

[53937] Another function of VGAM1580 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, N Polypeptide 2 (PTPRN2, Accession NM\_130842). Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRN2. LOC203286 (Accession XM\_117526) is another VGAM1580 host target gene. LOC203286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43498, to the nucleotide sequence of VGAM1580 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4291.

[53938] Another function of VGAM1580 is therefore inhibition of LOC203286 (Accession XM\_117526). Accordingly, utilities of VGAM1580 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1581 (VGAM1581) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53939] VGAM1581 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1581 was detected is described hereinabove with reference to Figs. 1–8.

[53940] VGAM1581 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53941] VGAM1581 gene encodes a VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1581 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1581 precursor RNA is designated SEQ ID:1567, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1567 is located at position 94704 relative to the genome of Saimiriine Herpesvirus 2.

[53942] VGAM1581 precursor RNA folds onto itself, forming VGAM1581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53943] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1581 folded precursor RNA into VGAM1581 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM1581 RNA is designated SEQ ID:4292, and is provided hereinbelow with reference to the sequence listing part.

[53944] VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1581 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53945] VGAM1581 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1581 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1581 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53946] The complementary binding of VGAM1581 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1581 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1581 host target RNA into VGAM1581 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53947] It is appreciated that VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1581 host target genes. The mRNA of

each one of this plurality of VGAM1581 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1581 RNA, herein designated VGAM RNA, and which when bound by VGAM1581 RNA causes inhibition of translation of respective one or more VGAM1581 host target proteins.

[53948] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1581 gene, herein designated VGAM GENE, on one or more VGAM1581 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[53949] It is yet further appreciated that a function of VGAM1581 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1581 correlate with, and may be deduced from, the identity of the host target genes which VGAM1581 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53950] Nucleotide sequences of the VGAM1581 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1581 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1581 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1581 are further described hereinbelow with reference to Table 1.

[53951] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1581 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1581 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53952] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1581 gene, herein designated VGAM is inhibition of expression of VGAM1581 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1581 correlate with, and may be deduced from, the identity of the target genes which VGAM1581 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53953] Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM\_042963) is a VGAM1581 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33845, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53954] A function of VGAM1581 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6

(ARHGEF6, Accession XM\_042963). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. D4ST-1 (Accession NM\_130468) is another VGAM1581 host target gene. D4ST-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D4ST-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D4ST-1 BINDING SITE, designated SEQ ID:28228, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53955] Another function of VGAM1581 is therefore inhibition of D4ST-1 (Accession NM\_130468). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D4ST-1. KIAA0700 (Accession XM\_050561) is another VGAM1581 host target gene. KIAA0700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0700 BINDING SITE, designated SEQ ID:35658, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53956] Another function of VGAM1581 is therefore inhibition of KIAA0700 (Accession XM\_050561). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0700. RODH-4 (Accession NM\_003708) is another VGAM1581 host target gene. RODH-4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RODH-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RODH-4 BINDING SITE, designated SEQ ID:9808, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53957] Another function of VGAM1581 is therefore inhibition of RODH-4 (Accession NM\_003708). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH-4. Serine Palmitoyltransferase, Long Chain Base Subunit 2

(SPTLC2, Accession NM\_004863) is another VGAM1581 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11283, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53958] Another function of VGAM1581 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC147669 (Accession XM\_097262) is another VGAM1581 host target gene. LOC147669 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147669, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147669 BINDING SITE, designated SEQ ID:40856, to

the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53959] Another function of VGAM1581 is therefore inhibition of LOC147669 (Accession XM\_097262). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147669. LOC151438 (Accession XM\_098060) is another VGAM1581 host target gene. LOC151438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151438 BINDING SITE, designated SEQ ID:41347, to the nucleotide sequence of VGAM1581 RNA, herein designated VGAM RNA, also designated SEQ ID:4292.

[53960] Another function of VGAM1581 is therefore inhibition of LOC151438 (Accession XM\_098060). Accordingly, utilities of VGAM1581 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151438. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 1582 (VGAM1582) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53961] VGAM1582 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1582 was detected is described hereinabove with reference to Figs. 1–8.

[53962] VGAM1582 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53963] VGAM1582 gene encodes a VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1582 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1582 precursor RNA is designated SEQ ID:1568, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1568 is located at position 90201 relative to the genome of Saimiriine Herpesvirus 2.

[53964] VGAM1582 precursor RNA folds onto itself, forming VGAM1582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53965] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1582 folded precursor RNA into VGAM1582 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1582 RNA is designated SEQ ID:4293, and is provided hereinbelow with reference to the sequence listing part.

[53966] VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1582 host target RNA, herein designated

VGAM HOST TARGET RNA. VGAM1582 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[53967] VGAM1582 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1582 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1582 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53968] The complementary binding of VGAM1582 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1582 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1582 host target RNA into VGAM1582 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53969] It is appreciated that VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1582 host target genes. The mRNA of each one of this plurality of VGAM1582 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1582 RNA, herein designated VGAM RNA, and which when bound by VGAM1582 RNA causes inhibition of translation of respective one or more VGAM1582 host target proteins.

[53970] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1582 gene, herein designated VGAM GENE, on one or more VGAM1582 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[53971] It is yet further appreciated that a function of VGAM1582 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1582 correlate with, and may be deduced from, the identity of

the host target genes which VGAM1582 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[53972] Nucleotide sequences of the VGAM1582 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1582 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1582 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1582 are further described hereinbelow with reference to Table 1.

[53973] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1582 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1582 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[53974] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1582 gene, herein designated VGAM is inhibition of expression of VGAM1582 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1582 correlate with, and may be deduced from, the identity of the target genes which VGAM1582

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[53975] Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058197) is a VGAM1582 host target gene. CDKN2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN2A BINDING SITE, designated SEQ ID:27759, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53976] A function of VGAM1582 is therefore inhibition of Cyclin-dependent Kinase Inhibitor 2A (melanoma, p16, inhibits CDK4) (CDKN2A, Accession NM\_058197). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN2A. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012) is another VGAM1582 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8924, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53977] Another function of VGAM1582 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. APACD (Accession NM\_005783) is another VGAM1582 host target gene. APACD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APACD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APACD BINDING SITE, designated SEQ ID:12362, to the

nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53978] Another function of VGAM1582 is therefore inhibition of APACD (Accession NM\_005783). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APACD. ARNTL2 (Accession NM\_020183) is another VGAM1582 host target gene. ARNTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNTL2 BINDING SITE, designated SEQ ID:21409, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53979] Another function of VGAM1582 is therefore inhibition of ARNTL2 (Accession NM\_020183). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNTL2. DIS3 (Accession NM\_014953) is another VGAM1582 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17304, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53980] Another function of VGAM1582 is therefore inhibition of DIS3 (Accession NM\_014953). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. DKFZP564B1162 (Accession NM\_031305) is another VGAM1582 host target gene. DKFZP564B1162 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP564B1162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564B1162 BINDING SITE, designated SEQ ID:25339, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53981] Another function of VGAM1582 is therefore inhibition of

DKFZP564B1162 (Accession NM\_031305). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564B1162. GT650 (Accession NM\_052851) is another VGAM1582 host target gene. GT650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GT650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GT650 BINDING SITE, designated SEQ ID:27433, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53982] Another function of VGAM1582 is therefore inhibition of GT650 (Accession NM\_052851). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GT650. HTEX4 (Accession XM\_166378) is another VGAM1582 host target gene. HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HTEX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of HTEX4 BINDING SITE1 through HTEX4 BINDING SITE3, designated SEQ ID:44218, SEQ ID:46654 and SEQ ID:46723 respectively, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53983] Another function of VGAM1582 is therefore inhibition of HTEX4 (Accession XM\_166378). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTEX4. KIAA0830 (Accession XM\_045759) is another VGAM1582 host target gene. KIAA0830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0830 BINDING SITE, designated SEQ ID:34544, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53984] Another function of VGAM1582 is therefore inhibition of KIAA0830 (Accession XM\_045759). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0830. KIAA1254 (Accession XM\_046132) is another VGAM1582 host target gene. KIAA1254 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1254, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1254 BINDING SITE, designated SEQ ID:34697, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53985] Another function of VGAM1582 is therefore inhibition of KIAA1254 (Accession XM\_046132). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1254. MGC2827 (Accession NM\_023940) is another VGAM1582 host target gene. MGC2827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2827 BINDING SITE, designated SEQ ID:23427, to the nucleotide

sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53986] Another function of VGAM1582 is therefore inhibition of MGC2827 (Accession NM\_023940). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2827. LOC158798 (Accession XM\_088671) is another VGAM1582 host target gene. LOC158798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158798 BINDING SITE, designated SEQ ID:39891, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53987] Another function of VGAM1582 is therefore inhibition of LOC158798 (Accession XM\_088671). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158798. LOC161357 (Accession XM\_090827) is another VGAM1582 host target gene. LOC161357 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by LOC161357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161357 BINDING SITE, designated SEQ ID:40017, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53988] Another function of VGAM1582 is therefore inhibition of LOC161357 (Accession XM\_090827). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161357. LOC199863 (Accession XM\_117147) is another VGAM1582 host target gene. LOC199863 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC199863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199863 BINDING SITE, designated SEQ ID:43253, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53989] Another function of VGAM1582 is therefore inhibition of LOC199863 (Accession XM\_117147). Accordingly, utilities

of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199863. LOC221895 (Accession XM\_166511) is another VGAM1582 host target gene. LOC221895 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221895 BINDING SITE, designated SEQ ID:44440, to the nucleotide sequence of VGAM1582 RNA, herein designated VGAM RNA, also designated SEQ ID:4293.

[53990] Another function of VGAM1582 is therefore inhibition of LOC221895 (Accession XM\_166511). Accordingly, utilities of VGAM1582 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221895. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1583 (VGAM1583) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[53991] VGAM1583 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1583 was detected is described hereinabove with reference to Figs. 1–8.

[53992] VGAM1583 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[53993] VGAM1583 gene encodes a VGAM1583 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1583 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1583 precursor RNA is designated SEQ ID:1569, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1569 is located at position 93157 relative to the genome of Saimiriine Herpesvirus 2.

[53994] VGAM1583 precursor RNA folds onto itself, forming VGAM1583 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[53995] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1583 folded precursor RNA into VGAM1583 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM1583 RNA is designated SEQ ID:4294, and is provided hereinbelow with reference to the sequence listing part.

[53996] VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1583 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[53997] VGAM1583 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1583 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1583 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[53998] The complementary binding of VGAM1583 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1583 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1583 host target RNA into VGAM1583 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[53999] It is appreciated that VGAM1583 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1583 host target genes. The mRNA of each one of this plurality of VGAM1583 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1583 RNA, herein designated VGAM RNA, and which when bound by VGAM1583 RNA causes inhibition of translation of respective one or more VGAM1583 host target proteins.

[54000] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1583 gene, herein designated VGAM GENE, on one or more VGAM1583 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54001] It is yet further appreciated that a function of VGAM1583 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1583 correlate with, and may be deduced from, the identity of the host target genes which VGAM1583 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54002] Nucleotide sequences of the VGAM1583 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1583 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1583 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1583 are further  
described hereinbelow with reference to Table 1.

[54003] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1583 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1583 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54004] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1583 gene, herein designated VGAM is  
inhibition of expression of VGAM1583 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1583 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1583  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54005] Fibronectin Leucine Rich Transmembrane Protein 2  
(FLRT2, Accession NM\_013231) is a VGAM1583 host tar-

get gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:14874, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54006] A function of VGAM1583 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM\_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 duncce homolog, *Drosophila*) (PDE4D, Accession XM\_056815) is another VGAM1583 host target gene. PDE4D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36427, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54007] Another function of VGAM1583 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, *Drosophila*) (PDE4D, Accession XM\_056815), a gene which has similarity to *Drosophila* dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Toll-like 1 (TLL1, Accession NM\_012464) is another VGAM1583 host target gene. TLL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TLL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TLL1 BINDING SITE, designated SEQ ID:14836, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54008] Another function of VGAM1583 is therefore inhibition of Tolloid-like 1 (TLL1, Accession NM\_012464), a gene which is involved in bone morphogenesis. Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TLL1. The function of TLL1 has been established by previous studies. Scott et al. (1999) compared enzymatic activities and expression domains of 4 mammalian BMP1/TLD-like proteases and found differences in their ability to process fibrillar collagen precursors and to cleave chordin (OMIM Ref. No. 603475). As previously demonstrated for BMP1 and TLD, TLL1 specifically processes procollagen C-propeptides at the physiologically relevant site, whereas TLL2 (OMIM Ref. No. 606743) lacks this activity. BMP1 and TLL1 cleave chordin, at sites similar to procollagen C-propeptide cleavage sites, and counteract dorsalizing effects of chordin upon overexpression on *Xenopus* embryos. Proteases TLD and TLL2 do not

cleave chordin. Animal model experiments lend further support to the function of TLL1. Clark et al. (1999) used gene targeting in embryonic stem cells to produce mice with a disrupted allele for Tll1. Homozygous mutants were embryonic lethal, with death at midgestation from cardiac failure and a constellation of developmental defects confined to the heart. Constant features were incomplete formation of the muscular interventricular septum and an abnormal and novel positioning of the heart and aorta.

[54009] It is appreciated that the abovementioned animal model for TLL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[54010] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54011] Scott, I. C.; Blitz, I. L.; Pappano, W. N.; Imamura, Y.; Clark, T. G.; Steiglitz, B. M.; Thomas, C. L.; Maas, S. A.; Takahara, K.; Cho, K. W. Y.; Greenspan, D. S. : Mammalian BMP-1/tolloid-related metalloproteinases, including novel family member mammalian tolloid-like 2, have differential enzymatic activities and distributions of expression relevant to patterning and skeletogenesis. Dev. Biol. 213:

283–300, 1999. ; and

[54012] Clark, T. G.; Conway, S. J.; Scott, I. C.; Labosky, P. A.; Win-  
nier, G.; Bundy, J.; Hogan, B. L. M.; Greenspan, D. S. : The  
mammalian Tolloid-like 1 gene, Tll1, is necessary for nor-  
mal s.

[54013] Further studies establishing the function and utilities of  
TLL1 are found in John Hopkins OMIM database record ID  
606742, and in cited publications numbered 548 and  
5483–5484 listed in the bibliography section hereinbelow,  
which are also hereby incorporated by refer-  
ence. Aldo-keto Reductase Family 1, Member D1 (delta  
4–3–ketosteroid–5–beta–reductase) (AKR1D1, Accession  
NM\_005989) is another VGAM1583 host target gene.  
AKR1D1 BINDING SITE is HOST TARGET binding site found  
in the 3` untranslated region of mRNA encoded by  
AKR1D1, corresponding to a HOST TARGET binding site  
such as BINDING SITE I, BINDING SITE II or BINDING SITE III.  
Table 2 illustrates the complementarity of the nucleotide  
sequences of AKR1D1 BINDING SITE, designated SEQ  
ID:12609, to the nucleotide sequence of VGAM1583 RNA,  
herein designated VGAM RNA, also designated SEQ  
ID:4294.

[54014] Another function of VGAM1583 is therefore inhibition of

Aldo-keto Reductase Family 1, Member D1 (delta 4-3-ketosteroid-5-beta-reductase) (AKR1D1, Accession NM\_005989). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKR1D1. FLJ14803 (Accession NM\_032842) is another VGAM1583 host target gene. FLJ14803 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14803, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14803 BINDING SITE, designated SEQ ID:26625, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54015] Another function of VGAM1583 is therefore inhibition of FLJ14803 (Accession NM\_032842). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14803. FLJ22795 (Accession NM\_025084) is another VGAM1583 host target gene. FLJ22795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22795, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22795 BINDING SITE, designated SEQ ID:24686, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54016] Another function of VGAM1583 is therefore inhibition of FLJ22795 (Accession NM\_025084). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22795. H2A Histone Family, Member J (H2AFJ, Accession NM\_018267) is another VGAM1583 host target gene. H2AFJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H2AFJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H2AFJ BINDING SITE, designated SEQ ID:20235, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54017] Another function of VGAM1583 is therefore inhibition of H2A Histone Family, Member J (H2AFJ, Accession

NM\_018267). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H2AFJ. KIAA0737 (Accession NM\_014828) is another VGAM1583 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:16818, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54018] Another function of VGAM1583 is therefore inhibition of KIAA0737 (Accession NM\_014828). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. KIAA1582 (Accession XM\_037262) is another VGAM1583 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32577, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54019] Another function of VGAM1583 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335) is another VGAM1583 host target gene. PRPF8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRPF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRPF8 BINDING SITE, designated SEQ ID:30683, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54020] Another function of VGAM1583 is therefore inhibition of PRP8 Pre-mRNA Processing Factor 8 Homolog (yeast) (PRPF8, Accession XM\_028335). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with PRPF8. Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967) is another VGAM1583 host target gene. SNTG1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SNTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTG1 BINDING SITE, designated SEQ ID:21040, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54021] Another function of VGAM1583 is therefore inhibition of Syntrophin, Gamma 1 (SNTG1, Accession NM\_018967). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTG1. LOC143465 (Accession XM\_096430) is another VGAM1583 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, desig-

nated SEQ ID:40363, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54022] Another function of VGAM1583 is therefore inhibition of LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC145717 (Accession XM\_039771) is another VGAM1583 host target gene. LOC145717 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145717, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145717 BINDING SITE, designated SEQ ID:33186, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54023] Another function of VGAM1583 is therefore inhibition of LOC145717 (Accession XM\_039771). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145717. LOC145725 (Accession XM\_085211) is another VGAM1583 host target gene. LOC145725 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145725, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145725 BINDING SITE, designated SEQ ID:37943, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54024] Another function of VGAM1583 is therefore inhibition of LOC145725 (Accession XM\_085211). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145725. LOC145732 (Accession XM\_085218) is another VGAM1583 host target gene. LOC145732 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145732, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145732 BINDING SITE, designated SEQ ID:37952, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54025] Another function of VGAM1583 is therefore inhibition of LOC145732 (Accession XM\_085218). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145732. LOC196957 (Accession XM\_113789) is another VGAM1583 host target gene. LOC196957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196957 BINDING SITE, designated SEQ ID:42424, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54026] Another function of VGAM1583 is therefore inhibition of LOC196957 (Accession XM\_113789). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC196957. LOC196961 (Accession XM\_113790) is another VGAM1583 host target gene. LOC196961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196961 BINDING SITE, designated SEQ ID:42433, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54027] Another function of VGAM1583 is therefore inhibition of LOC196961 (Accession XM\_113790). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196961. LOC197138 (Accession XM\_113829) is another VGAM1583 host target gene. LOC197138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197138 BINDING SITE, designated SEQ ID:42451, to the nucleotide sequence of VGAM1583 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4294.

[54028] Another function of VGAM1583 is therefore inhibition of LOC197138 (Accession XM\_113829). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197138. LOC201475 (Accession XM\_113967) is another VGAM1583 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:42577, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54029] Another function of VGAM1583 is therefore inhibition of LOC201475 (Accession XM\_113967). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. LOC220537 (Accession XM\_165406) is another VGAM1583 host target gene. LOC220537 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220537, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220537 BINDING SITE, designated SEQ ID:43619, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54030] Another function of VGAM1583 is therefore inhibition of LOC220537 (Accession XM\_165406). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220537. LOC221806 (Accession XM\_166518) is another VGAM1583 host target gene. LOC221806 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221806 BINDING SITE, designated SEQ ID:44452, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54031] Another function of VGAM1583 is therefore inhibition of LOC221806 (Accession XM\_166518). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC221806. LOC245727 (Accession XM\_165913) is another VGAM1583 host target gene. LOC245727 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245727, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245727 BINDING SITE, designated SEQ ID:43793, to the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54032] Another function of VGAM1583 is therefore inhibition of LOC245727 (Accession XM\_165913). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245727. LOC254065 (Accession XM\_173239) is another VGAM1583 host target gene. LOC254065 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254065 BINDING SITE, designated SEQ ID:46524, to

the nucleotide sequence of VGAM1583 RNA, herein designated VGAM RNA, also designated SEQ ID:4294.

[54033] Another function of VGAM1583 is therefore inhibition of LOC254065 (Accession XM\_173239). Accordingly, utilities of VGAM1583 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254065. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1584 (VGAM1584) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54034] VGAM1584 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1584 was detected is described hereinabove with reference to Figs. 1–8.

[54035] VGAM1584 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54036] VGAM1584 gene encodes a VGAM1584 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1584 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1584 precursor RNA is designated SEQ ID:1570, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1570 is located at position 91273 relative to the genome of Saimiriine Herpesvirus 2.

[54037] VGAM1584 precursor RNA folds onto itself, forming VGAM1584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54038] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1584 folded precursor RNA into VGAM1584 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 56%) nucleotide sequence of VGAM1584 RNA is designated SEQ ID:4295, and is provided hereinbelow with reference to the sequence listing part.

[54039] VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1584 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54040] VGAM1584 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1584 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1584 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54041] The complementary binding of VGAM1584 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1584 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1584 host target RNA into VGAM1584 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54042] It is appreciated that VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1584 host target genes. The mRNA of each one of this plurality of VGAM1584 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1584 RNA, herein designated VGAM RNA, and which when bound by VGAM1584 RNA causes inhibition of translation of respective one or more VGAM1584 host target proteins.

[54043] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1584 gene, herein designated VGAM GENE, on one or more VGAM1584 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[54044] It is yet further appreciated that a function of VGAM1584 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1584 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1584 correlate with, and may be deduced from, the identity of the host target genes which VGAM1584 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54045] Nucleotide sequences of the VGAM1584 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1584 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1584 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1584 are further described hereinbelow with reference to Table 1.

[54046] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1584 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1584 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54047] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1584 gene, herein designated VGAM is inhibition of expression of VGAM1584 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1584 correlate with, and may be deduced from, the identity of the target genes which VGAM1584 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54048] FLJ20456 (Accession NM\_017831) is a VGAM1584 host target gene. FLJ20456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20456 BINDING SITE, designated SEQ ID:19493, to the nucleotide sequence of VGAM1584 RNA, herein designated VGAM RNA, also designated SEQ ID:4295.

[54049] A function of VGAM1584 is therefore inhibition of FLJ20456 (Accession NM\_017831). Accordingly, utilities of

VGAM1584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20456. KIAA1582 (Accession XM\_037262) is another VGAM1584 host target gene. KIAA1582 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1582, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1582 BINDING SITE, designated SEQ ID:32578, to the nucleotide sequence of VGAM1584 RNA, herein designated VGAM RNA, also designated SEQ ID:4295.

[54050] Another function of VGAM1584 is therefore inhibition of KIAA1582 (Accession XM\_037262). Accordingly, utilities of VGAM1584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1582. Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355) is another VGAM1584 host target gene. TRIM38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of TRIM38 BINDING SITE, designated SEQ ID:13049, to the nucleotide sequence of VGAM1584 RNA, herein designated VGAM RNA, also designated SEQ ID:4295.

[54051] Another function of VGAM1584 is therefore inhibition of Tripartite Motif-containing 38 (TRIM38, Accession NM\_006355). Accordingly, utilities of VGAM1584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM38. LOC219673 (Accession XM\_167567) is another VGAM1584 host target gene. LOC219673 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219673 BINDING SITE, designated SEQ ID:44691, to the nucleotide sequence of VGAM1584 RNA, herein designated VGAM RNA, also designated SEQ ID:4295.

[54052] Another function of VGAM1584 is therefore inhibition of LOC219673 (Accession XM\_167567). Accordingly, utilities of VGAM1584 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC219673. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1585 (VGAM1585) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54053] VGAM1585 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1585 was detected is described hereinabove with reference to Figs. 1–8.

[54054] VGAM1585 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54055] VGAM1585 gene encodes a VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1585 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1585 precursor RNA is designated SEQ ID:1571, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1571 is located at position 87716 relative to the genome of Saimiriine Herpesvirus 2.

- [54056] VGAM1585 precursor RNA folds onto itself, forming VGAM1585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54057] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1585 folded precursor RNA into VGAM1585 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1585 RNA is designated SEQ ID:4296, and is provided hereinbelow with reference to the sequence listing part.

[54058] VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1585 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[54059] VGAM1585 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1585 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1585 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54060] The complementary binding of VGAM1585 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1585 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1585 host target RNA into VGAM1585 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54061] It is appreciated that VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1585 host target genes. The mRNA of each one of this plurality of VGAM1585 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1585 RNA, herein designated VGAM RNA, and which when bound by VGAM1585 RNA causes

inhibition of translation of respective one or more VGAM1585 host target proteins.

[54062] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1585 gene, herein designated VGAM GENE, on one or more VGAM1585 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54063] It is yet further appreciated that a function of VGAM1585 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1585 include diagnosis, prevention and

treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1585 correlate with, and may be deduced from, the identity of the host target genes which VGAM1585 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54064] Nucleotide sequences of the VGAM1585 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1585 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1585 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1585 are further described hereinbelow with reference to Table 1.

[54065] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1585 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1585 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54066] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1585 gene, herein designated VGAM is inhibition of expression of VGAM1585 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1585 correlate with, and may be deduced from, the identity of the target genes which VGAM1585 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54067] Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921) is a VGAM1585 host target gene. CLCA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCA3 BINDING SITE, designated SEQ ID:11353, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54068] A function of VGAM1585 is therefore inhibition of Chloride Channel, Calcium Activated, Family Member 3 (CLCA3, Accession NM\_004921), a gene which is similar to calcium-activated chloride channel family. Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCA3. The function of CLCA3 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM595. Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228) is another VGAM1585 host target gene. EGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFR BINDING SITE, designated SEQ ID:11719, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54069] Another function of VGAM1585 is therefore inhibition of Epidermal Growth Factor Receptor (erythroblastic leukemia viral (v-erb-b) Oncogene Homolog, Avian) (EGFR, Accession NM\_005228), a gene which is a receptor for egf, but also for other members of the egf family. Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFR. The function of EGFR and its association with various diseases and clinical conditions, has

been established by previous studies, as described hereinabove with reference to VGAM229. G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490) is another VGAM1585 host target gene. GPR48 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR48, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:20552, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54070] Another function of VGAM1585 is therefore inhibition of G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490), a gene which binds to follicle-stimulating hormone and thyroid-stimulating hormone. Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48. The function of GPR48 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM376. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM1585

host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8525, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54071] Another function of VGAM1585 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793) is another VGAM1585 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:6459 and SEQ ID:15170 respectively, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54072] Another function of VGAM1585 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_000793). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. Solute Carrier Family 7, (cationic amino acid transporter,  $\gamma^+$  system) Member 11 (SLC7A11, Accession NM\_014331) is another VGAM1585 host target gene. SLC7A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A11 BINDING SITE, designated SEQ ID:15646, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54073] Another function of VGAM1585 is therefore inhibition of Solute Carrier Family 7, (cationic amino acid transporter, y<sup>+</sup> system) Member 11 (SLC7A11, Accession NM\_014331). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A11. SRY (sex determining region Y)-box 7 (SOX7, Accession NM\_031439) is another VGAM1585 host target gene. SOX7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX7 BINDING SITE, designated SEQ ID:25450, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54074] Another function of VGAM1585 is therefore inhibition of SRY (sex determining region Y)-box 7 (SOX7, Accession NM\_031439). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX7. LOC158629 (Accession XM\_098972) is another VGAM1585 host target gene. LOC158629 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:42017, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54075] Another function of VGAM1585 is therefore inhibition of LOC158629 (Accession XM\_098972). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC168512 (Accession XM\_095148) is another VGAM1585 host target gene. LOC168512 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC168512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168512 BINDING SITE, designated SEQ ID:40252, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54076] Another function of VGAM1585 is therefore inhibition of

LOC168512 (Accession XM\_095148). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168512. LOC51205 (Accession NM\_016361) is another VGAM1585 host target gene. LOC51205 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51205 BINDING SITE, designated SEQ ID:18501, to the nucleotide sequence of VGAM1585 RNA, herein designated VGAM RNA, also designated SEQ ID:4296.

[54077] Another function of VGAM1585 is therefore inhibition of LOC51205 (Accession NM\_016361). Accordingly, utilities of VGAM1585 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51205. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1586 (VGAM1586) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[54078] VGAM1586 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1586 was detected is described hereinabove with reference to Figs. 1–8.

[54079] VGAM1586 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54080] VGAM1586 gene encodes a VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1586 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1586 precursor RNA is designated SEQ ID:1572, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1572 is located at position 86610 relative to the genome of Saimiriine Herpesvirus 2.

[54081] VGAM1586 precursor RNA folds onto itself, forming VGAM1586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54082] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1586 folded precursor RNA into VGAM1586 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM1586 RNA is designated SEQ ID:4297, and is provided hereinbelow with reference to the sequence listing part.

[54083] VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1586 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[54084] VGAM1586 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1586 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1586 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[54085] The complementary binding of VGAM1586 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1586 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1586 host target RNA into VGAM1586 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54086] It is appreciated that VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1586 host target genes. The mRNA of each one of this plurality of VGAM1586 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1586 RNA, herein designated VGAM RNA, and which when bound by VGAM1586 RNA causes inhibition of translation of respective one or more VGAM1586 host target proteins.

[54087] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1586 gene, herein designated VGAM GENE, on one

or more VGAM1586 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54088] It is yet further appreciated that a function of VGAM1586 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1586 correlate with, and may be deduced from, the identity of the host target genes which VGAM1586 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54089] Nucleotide sequences of the VGAM1586 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1586 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1586 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1586 are further described hereinbelow with reference to Table 1.

[54090] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1586 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1586 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54091] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1586 gene, herein designated VGAM is inhibition of expression of VGAM1586 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1586 correlate with, and may be deduced from, the identity of the target genes which VGAM1586 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54092] Guanine Nucleotide Binding Protein (G protein), Gamma

Transducing Activity Polypeptide 2 (GNGT2, Accession NM\_031498) is a VGAM1586 host target gene. GNGT2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNGT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNGT2 BINDING SITE, designated SEQ ID:25578, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54093] A function of VGAM1586 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Gamma Transducing Activity Polypeptide 2 (GNGT2, Accession NM\_031498), a gene which is involved as a modulator or transducer in various transmembrane signaling systems. Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNGT2. The function of GNGT2 has been established by previous studies. Phototransduction in the vertebrate rod and cone photoreceptors is regulated by structurally homologous but distinct groups of signaling proteins. Ong et al. (1995) identified in bovine retinas a cone-specific G protein gamma subunit, G-gamma-c

(previously named G-gamma-8), which may play a key role in coupling the cone visual pigment to phosphodiesterase. Ong et al. (1997) characterized the human homolog, which was found to share a high degree of sequence identity with the corresponding bovine isoform (85%) and human rod G-gamma-1 (63%). The protein is specifically localized in cones, as indicated by immunohistochemical staining. Nucleotide sequence analysis of the gene, designated GNGT2, showed a structure consisting of 3 exons and 2 introns, with the intron splice sites similar to those of the rod G-gamma-1 gene (GNGT1; 189970). By FISH, Ong et al. (1997) localized the GNGT2 gene to 17q21.

[54094] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54095] Ong, O. C.; Hu, K.; Rong, H.; Lee, R. H.; Fung, B. K.-K. : Gene structure and chromosome localization of the G-gamma-c subunit of human cone G-protein (GNGT2). Genomics 44: 101-109, 1997. ; and

[54096] Ong, O. C.; Yamane, H. K.; Phan, K. B.; Fong, H. K.; Bok, D.; Lee, R. H.; Fung, B. K.-K. : Molecular cloning and characterization of the G protein gamma subunit of cone pho-

toreceptors.

[54097] Further studies establishing the function and utilities of GNGT2 are found in John Hopkins OMIM database record ID 603655, and in cited publications numbered 5859–5860 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM\_022735) is another VGAM1586 host target gene. GOCAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOCAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOCAP1 BINDING SITE, designated SEQ ID:22937, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54098] Another function of VGAM1586 is therefore inhibition of Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM\_022735). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOCAP1. LIM Domains Containing 1 (LIMD1, Accession NM\_014240) is an–

other VGAM1586 host target gene. LIMD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIMD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMD1 BINDING SITE, designated SEQ ID:15498, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54099] Another function of VGAM1586 is therefore inhibition of LIM Domains Containing 1 (LIMD1, Accession NM\_014240). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMD1. Neuregulin 1 (NRG1, Accession NM\_013959) is another VGAM1586 host target gene. NRG1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRG1 BINDING SITE, designated SEQ ID:15139, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54100] Another function of VGAM1586 is therefore inhibition of Neuregulin 1 (NRG1, Accession NM\_013959), a gene which is essential for neuronal development. Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRG1. The function of NRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1259. ADMP (Accession NM\_145035) is another VGAM1586 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29653, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54101] Another function of VGAM1586 is therefore inhibition of ADMP (Accession NM\_145035). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. BM045 (Accession XM\_085509) is another VGAM1586

host target gene. BM045 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BM045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM045 BINDING SITE, designated SEQ ID:38214, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54102] Another function of VGAM1586 is therefore inhibition of BM045 (Accession XM\_085509). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM045. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966) is another VGAM1586 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:27526, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ

ID:4297.

[54103] Another function of VGAM1586 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM\_052966). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. FLJ20093 (Accession NM\_017664) is another VGAM1586 host target gene. FLJ20093 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20093 BINDING SITE, designated SEQ ID:19204, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54104] Another function of VGAM1586 is therefore inhibition of FLJ20093 (Accession NM\_017664). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20093. FLJ22037 (Accession XM\_168215) is another VGAM1586 host target gene. FLJ22037 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by FLJ22037, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22037 BINDING SITE, designated SEQ ID:45074, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54105] Another function of VGAM1586 is therefore inhibition of FLJ22037 (Accession XM\_168215). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22037. KIAA0564 (Accession XM\_038664) is another VGAM1586 host target gene. KIAA0564 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0564, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0564 BINDING SITE, designated SEQ ID:32899, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54106] Another function of VGAM1586 is therefore inhibition of KIAA0564 (Accession XM\_038664). Accordingly, utilities

of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0564. KIAA0694 (Accession XM\_051970) is another VGAM1586 host target gene. KIAA0694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0694 BINDING SITE, designated SEQ ID:35929, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54107] Another function of VGAM1586 is therefore inhibition of KIAA0694 (Accession XM\_051970). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0694. P15-2 (Accession NM\_018698) is another VGAM1586 host target gene. P15-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P15-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P15-2 BINDING SITE,

designated SEQ ID:20781, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54108] Another function of VGAM1586 is therefore inhibition of P15-2 (Accession NM\_018698). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P15-2. Phytoceramidase, Alkaline (PHCA, Accession NM\_018367) is another VGAM1586 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20375, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54109] Another function of VGAM1586 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM\_018367). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. LOC196549 (Accession NM\_145293) is another VGAM1586 host target gene.

LOC196549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196549 BINDING SITE, designated SEQ ID:29807, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54110] Another function of VGAM1586 is therefore inhibition of LOC196549 (Accession NM\_145293). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196549. LOC221477 (Accession XM\_166397) is another VGAM1586 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44248, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54111] Another function of VGAM1586 is therefore inhibition of LOC221477 (Accession XM\_166397). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. LOC257017 (Accession XM\_173227) is another VGAM1586 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:46490, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54112] Another function of VGAM1586 is therefore inhibition of LOC257017 (Accession XM\_173227). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC257117 (Accession XM\_171238) is another VGAM1586 host target gene. LOC257117 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC257117, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257117 BINDING SITE, designated SEQ ID:46024, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54113] Another function of VGAM1586 is therefore inhibition of LOC257117 (Accession XM\_171238). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257117. LOC92973 (Accession XM\_048529) is another VGAM1586 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35181, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54114] Another function of VGAM1586 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92973. LOC93550 (Accession XM\_051999) is another VGAM1586 host target gene. LOC93550 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93550 BINDING SITE, designated SEQ ID:35931, to the nucleotide sequence of VGAM1586 RNA, herein designated VGAM RNA, also designated SEQ ID:4297.

[54115] Another function of VGAM1586 is therefore inhibition of LOC93550 (Accession XM\_051999). Accordingly, utilities of VGAM1586 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93550. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1587 (VGAM1587) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54116] VGAM1587 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene.

The method by which VGAM1587 was detected is described hereinabove with reference to Figs. 1–8.

[54117] VGAM1587 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54118] VGAM1587 gene encodes a VGAM1587 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1587 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1587 precursor RNA is designated SEQ ID:1573, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1573 is located at position 93438 relative to the genome of Saimiriine Herpesvirus 2.

[54119] VGAM1587 precursor RNA folds onto itself, forming VGAM1587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide

sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54120] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1587 folded precursor RNA into VGAM1587 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1587 RNA is designated SEQ ID:4298, and is provided hereinbelow with reference to the sequence listing part.

[54121] VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1587 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54122] VGAM1587 RNA, herein designated VGAM RNA, binds

complementarily to one or more host target binding sites located in untranslated regions of VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1587 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1587 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[54123] The complementary binding of VGAM1587 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM1587 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1587 host target RNA into VGAM1587 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54124] It is appreciated that VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1587 host target genes. The mRNA of each one of this plurality of VGAM1587 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1587 RNA, herein designated VGAM RNA, and which when bound by VGAM1587 RNA causes inhibition of translation of respective one or more VGAM1587 host target proteins.

[54125] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1587 gene, herein designated VGAM GENE, on one or more VGAM1587 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54126] It is yet further appreciated that a function of VGAM1587 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1587 correlate with, and may be deduced from, the identity of the host target genes which VGAM1587 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54127] Nucleotide sequences of the VGAM1587 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1587 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM1587 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1587 are further described hereinbelow with reference to Table 1.

[54128] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1587 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1587 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54129] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1587 gene, herein designated VGAM is inhibition of expression of VGAM1587 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1587 correlate with, and may be deduced from, the identity of the target genes which VGAM1587 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54130] Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM\_000391) is a VGAM1587 host target gene. CLN2 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by CLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:5962, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54131] A function of VGAM1587 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM\_000391). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM\_139125) is another VGAM1587 host target gene. MASP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MASP1 BINDING SITE, designated SEQ ID:29158, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA,

also designated SEQ ID:4298.

[54132] Another function of VGAM1587 is therefore inhibition of Mannan-binding Lectin Serine Protease 1 (C4/C2 activating component of Ra-reactive factor) (MASP1, Accession NM\_139125), a gene which a complement-dependent bactericidal factor . Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MASP1. The function of MASP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM566. RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650) is another VGAM1587 host target gene. RASA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASA1 BINDING SITE, designated SEQ ID:22905, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54133] Another function of VGAM1587 is therefore inhibition of

RAS P21 Protein Activator (GTPase activating protein) 1 (RASA1, Accession NM\_022650), a gene which is involved in the control of cellular proliferation and differentiation. Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASA1. The function of RASA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM464.FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_021910) is another VGAM1587 host target gene. FXYD3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FXYD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FXYD3 BINDING SITE, designated SEQ ID:22434, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54134] Another function of VGAM1587 is therefore inhibition of FXYD Domain Containing Ion Transport Regulator 3 (FXYD3, Accession NM\_021910). Accordingly, utilities of

VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FXD3. KIAA0555 (Accession NM\_014790) is another VGAM1587 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16680, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54135] Another function of VGAM1587 is therefore inhibition of KIAA0555 (Accession NM\_014790). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. KIAA0738 (Accession NM\_014719) is another VGAM1587 host target gene. KIAA0738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0738 BINDING SITE, designated SEQ ID:16278, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54136] Another function of VGAM1587 is therefore inhibition of KIAA0738 (Accession NM\_014719). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0738. PRO2086 (Accession NM\_014111) is another VGAM1587 host target gene. PRO2086 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO2086, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2086 BINDING SITE, designated SEQ ID:15345, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54137] Another function of VGAM1587 is therefore inhibition of PRO2086 (Accession NM\_014111). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2086. LOC253955 (Accession XM\_170486) is another VGAM1587 host target gene. LOC253955 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253955 BINDING SITE, designated SEQ ID:45326, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54138] Another function of VGAM1587 is therefore inhibition of LOC253955 (Accession XM\_170486). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253955. LOC51696 (Accession NM\_016217) is another VGAM1587 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18307, to the nucleotide sequence of VGAM1587 RNA, herein designated VGAM RNA, also designated SEQ ID:4298.

[54139] Another function of VGAM1587 is therefore inhibition of

LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM1587 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1588 (VGAM1588) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54140] VGAM1588 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1588 was detected is described hereinabove with reference to Figs. 1-8.

[54141] VGAM1588 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54142] VGAM1588 gene encodes a VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1588 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1588 precursor RNA is designated SEQ ID:1574, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1574 is located at position 90393 relative to the genome of Saimiriine Herpesvirus 2.

- [54143] VGAM1588 precursor RNA folds onto itself, forming VGAM1588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1588 folded precursor RNA into VGAM1588 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide se-

quence of VGAM1588 RNA is designated SEQ ID:4299, and is provided hereinbelow with reference to the sequence listing part.

[54145] VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1588 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54146] VGAM1588 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1588 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1588 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54147] The complementary binding of VGAM1588 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1588 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1588 host target RNA into VGAM1588 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54148] It is appreciated that VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1588 host target genes. The mRNA of each one of this plurality of VGAM1588 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1588 RNA, herein designated VGAM RNA, and which when bound by VGAM1588 RNA causes inhibition of translation of respective one or more VGAM1588 host target proteins.

[54149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1588 gene, herein designated VGAM GENE, on one or more VGAM1588 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54150] It is yet further appreciated that a function of VGAM1588

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM1588 correlate with, and may be deduced from, the identity of the host target genes which VGAM1588 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54151] Nucleotide sequences of the VGAM1588 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1588 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1588 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1588 are further described hereinbelow with reference to Table 1.

[54152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1588 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1588 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1588 gene, herein designated VGAM is inhibition of expression of VGAM1588 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1588 correlate with, and may be deduced from, the identity of the target genes which VGAM1588 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54154] Breast Cancer 1, Early Onset (BRCA1, Accession NM\_007295) is a VGAM1588 host target gene. BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by BRCA1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRCA1 BINDING SITE1 through BRCA1 BINDING SITE10, designated SEQ ID:14169, SEQ ID:14175, SEQ ID:14181, SEQ ID:14188, SEQ ID:14194, SEQ ID:14200, SEQ ID:14208, SEQ ID:14214, SEQ ID:14220 and SEQ ID:14163 respectively, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54155] A function of VGAM1588 is therefore inhibition of Breast

Cancer 1, Early Onset (BRCA1, Accession NM\_007295). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRCA1. Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405) is another VGAM1588 host target gene. ICMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICMT BINDING SITE, designated SEQ ID:14779, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54156] Another function of VGAM1588 is therefore inhibition of Isoprenylcysteine Carboxyl Methyltransferase (ICMT, Accession NM\_012405). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICMT. Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560) is another VGAM1588 host target gene. IL13RA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL13RA1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL13RA1 BINDING SITE, designated SEQ ID:7283, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54157] Another function of VGAM1588 is therefore inhibition of Interleukin 13 Receptor, Alpha 1 (IL13RA1, Accession NM\_001560), a gene which binds il-13 with a low affinity. together with il-4r- alpha can form a functional receptor for il-13. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL13RA1. The function of IL13RA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144. IRTA2 (Accession NM\_031281) is another VGAM1588 host target gene. IRTA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRTA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRTA2 BINDING SITE,

designated SEQ ID:25296, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54158] Another function of VGAM1588 is therefore inhibition of IRTA2 (Accession NM\_031281), a gene which binds to the fc region of immunoglobulins gamma low affinity receptor. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRTA2. The function of IRTA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Accession NM\_033118) is another VGAM1588 host target gene. MYLK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLK2 BINDING SITE, designated SEQ ID:26964, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54159] Another function of VGAM1588 is therefore inhibition of Myosin Light Chain Kinase 2, Skeletal Muscle (MYLK2, Accession NM\_033118). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLK2. Neuropeptide Y Receptor Y1 (NPY1R, Accession NM\_000909) is another VGAM1588 host target gene. NPY1R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPY1R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPY1R BINDING SITE, designated SEQ ID:6607, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54160] Another function of VGAM1588 is therefore inhibition of Neuropeptide Y Receptor Y1 (NPY1R, Accession NM\_000909), a gene which stimulates intracellular calcium flux and signals through an inhibitory G-protein. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPY1R. The function of NPY1R has been established by previous studies. Neuropeptide Y

(NPY; 162640) is one of the most abundant neuropeptides in the mammalian nervous system and exhibits a diverse range of important physiologic activities, including effects on psychomotor activity, food intake, regulation of central endocrine secretion, and potent vasoactive effects on the cardiovascular system. Two major subtypes of NPY (Y1 and Y2) have been defined by pharmacologic criteria. The NPY Y1 receptors have been identified in a variety of tissues, including brain, spleen, small intestine, kidney, testis, placenta, and aortic smooth muscle. The Y2 receptor is found mainly in the central nervous system. Herzog et al. (1992) reported cloning of a cDNA encoding a human NPY receptor which they confirmed to be a member of the G protein-coupled receptor superfamily. When expressed in Chinese hamster ovary (CHO) or human embryonic kidney cells, the receptor exhibited characteristic ligand specificity. In the kidney cell line, the receptor was coupled to a pertussis toxin-sensitive G protein that mediated the inhibition of cyclic AMP accumulation. In the CHO cell line, on the other hand, the receptor was coupled not to inhibition of adenylate cyclase but rather to the elevation of intracellular calcium. Thus the second messenger coupling of the NPY receptor was cell type specific,

depending on the specific repertoire of G proteins and effector systems present in the cell type. Larhammar et al. (1992) independently cloned and characterized the neuropeptide Y receptor. Animal model experiments lend further support to the function of NPY1R. Naveilhan et al. (2001) generated mice deficient in NPY1R by targeted disruption. *Npy1r*  $-/-$  mice developed hyperalgesia to acute thermal, cutaneous, and visceral chemical pain, and exhibited mechanical hypersensitivity. Neuropathic pain was increased and the mice showed a complete absence of the pharmacologic analgesic effects of NPY. In the periphery, Y1 receptor activation was sufficient and required for substance P release and the subsequent development of neurogenic inflammation and plasma leakage. Naveilhan et al. (2001) concluded that the Y1 receptor is required for central physiologic and pharmacologic NPY-induced analgesia and that its activation is both sufficient and required for the release of substance P and initiation of neurogenic inflammation.

[54161] It is appreciated that the abovementioned animal model for NPY1R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

- [54162] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [54163] Herzog, H.; Hort, Y. J.; Ball, H. J.; Hayes, G.; Shine, J.; Selbie, L. A. : Cloned human neuropeptide Y receptor couples to two different second messenger systems. *Proc. Nat. Acad. Sci.* 89: 5794–5798, 1992. ; and
- [54164] Naveilhan, P.; Hassani, H.; Lucas, G.; Blakeman, K. H.; Hao, J.-X.; Xu, X.-J.; Wiesenfeld-Hallin, Z.; Thoren, P.; Ernfors, P. : Reduced antinociception and plasma extravasation in mice.
- [54165] Further studies establishing the function and utilities of NPY1R are found in John Hopkins OMIM database record ID 162641, and in cited publications numbered 3214–3219 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM\_004580) is another VGAM1588 host target gene. RAB27A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB27A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RAB27A BINDING SITE, designated SEQ ID:10928, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54166] Another function of VGAM1588 is therefore inhibition of RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM\_004580). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB27A. Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968) is another VGAM1588 host target gene. SALL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL1 BINDING SITE, designated SEQ ID:8877, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54167] Another function of VGAM1588 is therefore inhibition of Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with SALL1. Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM\_004172) is another VGAM1588 host target gene. SLC1A3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SLC1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC1A3 BINDING SITE, designated SEQ ID:10382, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54168] Another function of VGAM1588 is therefore inhibition of Solute Carrier Family 1 (glial high affinity glutamate transporter), Member 3 (SLC1A3, Accession NM\_004172), a gene which is a transporter molecule that regulates neurotransmitter concentrations at excitatory synapses of the mammalian cns. Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC1A3. The function of SLC1A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM294.Zinc Finger Protein 134 (clone pHZ-15) (ZNF134, Accession NM\_003435) is another VGAM1588 host target gene. ZNF134 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ZNF134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF134 BINDING SITE, designated SEQ ID:9487, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54169] Another function of VGAM1588 is therefore inhibition of Zinc Finger Protein 134 (clone pHZ-15) (ZNF134, Accession NM\_003435). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF134. DKFZP434D193 (Accession XM\_114297) is another VGAM1588 host target gene. DKFZP434D193 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434D193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZP434D193 BINDING SITE, designated SEQ ID:42850, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54170] Another function of VGAM1588 is therefore inhibition of DKFZP434D193 (Accession XM\_114297). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434D193. DKFZp547I224 (Accession NM\_020221) is another VGAM1588 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21474, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54171] Another function of VGAM1588 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp547I224. FLJ20514 (Accession NM\_017856) is another VGAM1588 host target gene. FLJ20514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20514 BINDING SITE, designated SEQ ID:19534, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54172] Another function of VGAM1588 is therefore inhibition of FLJ20514 (Accession NM\_017856). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20514. FLJ32332 (Accession NM\_144641) is another VGAM1588 host target gene. FLJ32332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32332 BINDING SITE, designated SEQ ID:29468, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM

RNA, also designated SEQ ID:4299.

[54173] Another function of VGAM1588 is therefore inhibition of FLJ32332 (Accession NM\_144641). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32332. KIAA1349 (Accession XM\_047617) is another VGAM1588 host target gene. KIAA1349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1349 BINDING SITE, designated SEQ ID:35013, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54174] Another function of VGAM1588 is therefore inhibition of KIAA1349 (Accession XM\_047617). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1349. KIAA1918 (Accession XM\_054951) is another VGAM1588 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36214, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54175] Another function of VGAM1588 is therefore inhibition of KIAA1918 (Accession XM\_054951). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. Synaptotagmin-like 2 (SYTL2, Accession NM\_032943) is another VGAM1588 host target gene. SYTL2 BINDING SITE1 and SYTL2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SYTL2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYTL2 BINDING SITE1 and SYTL2 BINDING SITE2, designated SEQ ID:26758 and SEQ ID:26174 respectively, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54176] Another function of VGAM1588 is therefore inhibition of

Synaptotagmin-like 2 (SYTL2, Accession NM\_032943). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYTL2. LOC125704 (Accession XM\_058931) is another VGAM1588 host target gene. LOC125704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125704 BINDING SITE, designated SEQ ID:36798, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54177] Another function of VGAM1588 is therefore inhibition of LOC125704 (Accession XM\_058931). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125704. LOC221738 (Accession XM\_168097) is another VGAM1588 host target gene. LOC221738 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221738, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221738 BINDING SITE, designated SEQ ID:45028, to the nucleotide sequence of VGAM1588 RNA, herein designated VGAM RNA, also designated SEQ ID:4299.

[54178] Another function of VGAM1588 is therefore inhibition of LOC221738 (Accession XM\_168097). Accordingly, utilities of VGAM1588 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221738. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1589 (VGAM1589) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54179] VGAM1589 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1589 was detected is described hereinabove with reference to Figs. 1-8.

[54180] VGAM1589 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM1589 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[54181] VGAM1589 gene encodes a VGAM1589 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1589 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1589 precursor RNA is designated SEQ ID:1575, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1575 is located at position 88982 relative to the genome of Ateline Herpesvirus 3.

[54182] VGAM1589 precursor RNA folds onto itself, forming VGAM1589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54183] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1589 folded precursor RNA into VGAM1589

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1589 RNA is designated SEQ ID:4300, and is provided hereinbelow with reference to the sequence listing part.

[54184] VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1589 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54185] VGAM1589 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1589 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1589 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54186] The complementary binding of VGAM1589 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1589 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1589 host target RNA into VGAM1589 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[54187] It is appreciated that VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1589 host target genes. The mRNA of each one of this plurality of VGAM1589 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1589 RNA, herein designated VGAM RNA, and which when bound by VGAM1589 RNA causes inhibition of translation of respective one or more VGAM1589 host target proteins.

[54188] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1589 gene, herein designated VGAM GENE, on one or more VGAM1589 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54189] It is yet further appreciated that a function of VGAM1589 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1589 correlate with, and may be deduced from, the identity of the host target genes which VGAM1589 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54190] Nucleotide sequences of the VGAM1589 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1589 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1589 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1589 are further described hereinbelow with reference to Table 1.

[54191] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1589 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1589 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54192] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1589 gene, herein designated VGAM is inhibition of expression of VGAM1589 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1589 correlate with, and may be deduced from, the identity of the target genes which VGAM1589 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54193] Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147) is a VGAM1589 host target gene. EIF1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF1A BINDING SITE, designated SEQ ID:42715, to the nucleotide sequence of VGAM1589 RNA, herein designated

VGAM RNA, also designated SEQ ID:4300.

[54194] A function of VGAM1589 is therefore inhibition of Eukaryotic Translation Initiation Factor 1A (EIF1A, Accession XM\_114147), a gene which seems to be required for maximal rate of protein biosynthesis. Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF1A. The function of EIF1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120. Lactate Dehydrogenase B (LDHB, Accession NM\_002300) is another VGAM1589 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:8084, to the nucleotide sequence of VGAM1589 RNA, herein designated VGAM RNA, also designated SEQ ID:4300.

[54195] Another function of VGAM1589 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM\_002300), a gene which causes dehydrogenation of lactate. Accord-

ingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM273. Neurobeachin (NBEA, Accession XM\_170732) is another VGAM1589 host target gene. NBEA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NBEA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NBEA BINDING SITE, designated SEQ ID:45492, to the nucleotide sequence of VGAM1589 RNA, herein designated VGAM RNA, also designated SEQ ID:4300.

[54196] Another function of VGAM1589 is therefore inhibition of Neurobeachin (NBEA, Accession XM\_170732), a gene which may mediate protein-protein interactions. Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NBEA. The function of NBEA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM459. Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM\_006508) is another VGAM1589 host target gene. REGL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:13255, to the nucleotide sequence of VGAM1589 RNA, herein designated VGAM RNA, also designated SEQ ID:4300.

[54197] Another function of VGAM1589 is therefore inhibition of Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM\_006508), a gene which is a member of REG family with unknown function. Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL. The function of REGL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.FLJ21934 (Accession NM\_024743) is another

VGAM1589 host target gene. FLJ21934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21934 BINDING SITE, designated SEQ ID:24079, to the nucleotide sequence of VGAM1589 RNA, herein designated VGAM RNA, also designated SEQ ID:4300.

[54198] Another function of VGAM1589 is therefore inhibition of FLJ21934 (Accession NM\_024743). Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21934. Tripartite Motif-containing 2 (TRIM2, Accession NM\_015271) is another VGAM1589 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17594, to the nucleotide sequence of VGAM1589 RNA, herein designated VGAM RNA, also designated SEQ

ID:4300.

[54199] Another function of VGAM1589 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM\_015271). Accordingly, utilities of VGAM1589 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1590 (VGAM1590) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54200] VGAM1590 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1590 was detected is described hereinabove with reference to Figs. 1–8.

[54201] VGAM1590 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54202] VGAM1590 gene encodes a VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1590 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1590 precursor RNA is designated SEQ ID:1576, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1576 is located at position 91163 relative to the genome of Ateline Herpesvirus 3.

[54203] VGAM1590 precursor RNA folds onto itself, forming VGAM1590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54204] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1590 folded precursor RNA into VGAM1590 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM1590 RNA is designated SEQ ID:4301, and is provided hereinbelow with reference to the sequence listing part.

[54205] VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1590 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54206] VGAM1590 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1590 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1590 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54207] The complementary binding of VGAM1590 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1590 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1590 host target RNA into VGAM1590 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54208] It is appreciated that VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1590 host target genes. The mRNA of

each one of this plurality of VGAM1590 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1590 RNA, herein designated VGAM RNA, and which when bound by VGAM1590 RNA causes inhibition of translation of respective one or more VGAM1590 host target proteins.

[54209] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1590 gene, herein designated VGAM GENE, on one or more VGAM1590 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[54210] It is yet further appreciated that a function of VGAM1590 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1590 correlate with, and may be deduced from, the identity of the host target genes which VGAM1590 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54211] Nucleotide sequences of the VGAM1590 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1590 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1590 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1590 are further described hereinbelow with reference to Table 1.

[54212] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1590 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1590 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54213] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1590 gene, herein designated VGAM is inhibition of expression of VGAM1590 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1590 correlate with, and may be deduced from, the identity of the target genes which VGAM1590 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54214] EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is a VGAM1590 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41881, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54215] A function of VGAM1590 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM1590 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with EGFL5. Lectin, Mannose-binding, 1 (LMAN1, Accession NM\_005570) is another VGAM1590 host target gene. LMAN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LMAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMAN1 BINDING SITE, designated SEQ ID:12098, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54216] Another function of VGAM1590 is therefore inhibition of Lectin, Mannose-binding, 1 (LMAN1, Accession NM\_005570). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMAN1. Parathyroid Hormone-like Hormone (PTH LH, Accession NM\_002820) is another VGAM1590 host target gene. PTH LH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTH LH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PTHLH BINDING SITE, designated SEQ ID:8686, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54217] Another function of VGAM1590 is therefore inhibition of Parathyroid Hormone-like Hormone (PTHLH, Accession NM\_002820), a gene which plays a physiological role in lactation, possibly as a hormone for the mobilization and/or transfer of calcium to the milk. Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTHLH. The function of PTHLH has been established by previous studies. PTHRP is responsible for most cases of humoral hypercalcemia of malignancy. It mimics the actions of PTH because of its structural homology with PTH and its ability to bind to and signal via the PTH/PTHRP receptor in bone and kidney. PTHRP-(1-36) appears to be one of several secretory forms of PTHRP. When this peptide was given intravenously (iv) to normal volunteers, it produced the same effects as PTH-(1-34). To determine whether PTHRP-(1-36) could be used subcutaneously (sc) in humans as a diagnostic reagent to study differences between HHM and hyperparathyroidism, Henry et al. (1997)

examined whether sc PTHRP-(1-36) could affect mineral homeostasis. PTHRP-(1-36) given sc produced increases in circulating PTHRP-(1-36), reductions in serum phosphorus and the renal phosphorus threshold, increments in fractional calcium excretion and nephrogenous cAMP excretion, and increases in plasma 1,25-dihydroxyvitamin D. The authors concluded that it is feasible to use PTHRP-(1-36) in studies of HHM and hyperparathyroidism. Animal model experiments lend further support to the function of PTHLH. Philbrick et al. (1998) found that whereas PTHRP knockout mice die at birth with a chondrodystrophic phenotype, replacement of PTHRP expression in the chondrocytes of these knockout mice using a procollagen II-driven transgene resulted in the correction of the lethal skeletal abnormalities and generated animals that were effectively PTHRP-null in all sites other than cartilage. These rescued PTHRP knockout mice survived to at least 6 months of age but were small in stature and displayed a number of developmental defects, including cranial chondrodystrophy and a failure of tooth eruption. Teeth appeared to develop normally but became trapped by the surrounding bone and underwent progressive impaction. Localization of PTHRP mRNA during normal tooth

development by in situ hybridization showed increasing levels of expression in the enamel epithelium before the formation of the eruption pathway. The type 1 PTH/PTHrP receptor is expressed in both the adjacent dental mesenchyme and in alveolar bone. The replacement of PTHrP expression in the enamel epithelium with a keratin 14-driven transgene corrected the defect in bone resorption and restored the normal program of tooth eruption. PTHrP therefore represents an essential signal in the formation of the eruption pathway.

[54218] It is appreciated that the abovementioned animal model for PTHLH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[54219] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54220] Philbrick, W. M.; Dreyer, B. E.; Nakchbandi, I. A.; Karaplis, A. C. : Parathyroid hormone-related protein is required for tooth eruption. *Proc. Nat. Acad. Sci.* 95: 11846–11851, 1998. ; and

[54221] Strewler, G. J. : The physiology of parathyroid hormone-related protein. *New Eng. J. Med.* 342: 177–185, 2000.

[54222] Further studies establishing the function and utilities of PTHLH are found in John Hopkins OMIM database record ID 168470, and in cited publications numbered 10360–10365, 1642–1643, 3914, 10359–164 and 5451–1654 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM\_042096) is another VGAM1590 host target gene. RRM2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RRM2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RRM2B BINDING SITE, designated SEQ ID:33690, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54223] Another function of VGAM1590 is therefore inhibition of Ribonucleotide Reductase M2 B (TP53 inducible) (RRM2B, Accession XM\_042096). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RRM2B. FLJ14641 (Accession NM\_032817) is another VGAM1590

host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:26591, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54224] Another function of VGAM1590 is therefore inhibition of FLJ14641 (Accession NM\_032817). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641. FLJ20373 (Accession NM\_017792) is another VGAM1590 host target gene. FLJ20373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20373 BINDING SITE, designated SEQ ID:19427, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54225] Another function of VGAM1590 is therefore inhibition of FLJ20373 (Accession NM\_017792). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20373. NP220 (Accession NM\_014497) is another VGAM1590 host target gene. NP220 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by NP220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NP220 BINDING SITE, designated SEQ ID:15836, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54226] Another function of VGAM1590 is therefore inhibition of NP220 (Accession NM\_014497). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NP220. LOC148894 (Accession XM\_097542) is another VGAM1590 host target gene. LOC148894 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC148894, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:40916, to the nucleotide sequence of VGAM1590 RNA, herein designated VGAM RNA, also designated SEQ ID:4301.

[54227] Another function of VGAM1590 is therefore inhibition of LOC148894 (Accession XM\_097542). Accordingly, utilities of VGAM1590 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1591 (VGAM1591) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54228] VGAM1591 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1591 was detected is described hereinabove with reference to Figs. 1-8.

[54229] VGAM1591 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM1591 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[54230] VGAM1591 gene encodes a VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1591 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1591 precursor RNA is designated SEQ ID:1577, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1577 is located at position 90226 relative to the genome of Ateline Herpesvirus 3.

[54231] VGAM1591 precursor RNA folds onto itself, forming VGAM1591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54232] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1591 folded precursor RNA into VGAM1591

RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM1591 RNA is designated SEQ ID:4302, and is provided hereinbelow with reference to the sequence listing part.

[54233] VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1591 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54234] VGAM1591 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1591 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1591 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54235] The complementary binding of VGAM1591 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1591 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1591 host target RNA into VGAM1591 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM

host target protein is therefore outlined by a broken line.

[54236] It is appreciated that VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1591 host target genes. The mRNA of each one of this plurality of VGAM1591 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1591 RNA, herein designated VGAM RNA, and which when bound by VGAM1591 RNA causes inhibition of translation of respective one or more VGAM1591 host target proteins.

[54237] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1591 gene, herein designated VGAM GENE, on one or more VGAM1591 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54238] It is yet further appreciated that a function of VGAM1591 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1591 correlate with, and may be deduced from, the identity of the host target genes which VGAM1591 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54239] Nucleotide sequences of the VGAM1591 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1591 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1591 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1591 are further described hereinbelow with reference to Table 1.

[54240] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1591 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1591 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54241] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1591 gene, herein designated VGAM is inhibition of expression of VGAM1591 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1591 correlate with, and may be deduced from, the identity of the target genes which VGAM1591 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54242] Bagpipe Homeobox Homolog 1 (Drosophila) (BAPX1, Accession NM\_001189) is a VGAM1591 host target gene. BAPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAPX1 BINDING SITE, designated SEQ ID:6861, to the nucleotide sequence of VGAM1591 RNA, herein

designated VGAM RNA, also designated SEQ ID:4302.

[54243] A function of VGAM1591 is therefore inhibition of Bagpipe Homeobox Homolog 1 (Drosophila) (BAPX1, Accession NM\_001189), a gene which regulates gene expression, morphogenesis, and differentiation. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAPX1. The function of BAPX1 has been established by previous studies. Yoshiura and Murray (1997) reported the sequence of the human homolog of BAPX1 and localized it to human 4p16.1 by linkage mapping on CEPH families with polymorphic markers identified from the genomic sequence near the gene. They suggested the human BAPX1 gene as a candidate gene for disorders of skeletal development that map to 4p16.1, such as Ellis–van Creveld syndrome (OMIM Ref. No. 225500). Tribioli and Lufkin (1997) cloned the BAPX1 gene by screening a human genomic placenta library with a genomic fragment of the mouse gene. The predicted 333–amino acid sequence of the human gene product had 85% overall identity to the product of the murine gene, with 100% identity in the homeodomain. By fluorescence in situ hybridization, they mapped the BAPX1 gene to 4p16.1 in a region of syntenic

homology with mouse chromosome 5 where the mouse gene had been mapped. RT-PCR analysis demonstrated that BAPX1 is expressed in embryonic tissues, particularly the limb, and at a lower level in an embryonic lung cell line. RNA in situ hybridization showed that BAPX1 is predominantly expressed in mesenchymal condensations of the fetal limb and axial skeleton, and in lateral plate mesoderm giving rise to visceral muscle. Tribioli et al. (1997) showed that expression of Bapx1 is first detectable in embryos just before axis rotation in lateral plate mesoderm (splanchnic mesoderm) adjacent to the endodermal lining of the prospective gut, and in the most newly formed somites in the region corresponding to the presclerotome, the precursor of the vertebrae. Thus, Bapx1 is one of the earliest developmental markers for the sclerotome portion of the somite and the gut mesentery. Bapx1 continues to be expressed well into organogenesis in lateral plate mesoderm surrounding the mid- and hindgut, and in essentially all cartilaginous condensations that will subsequently undergo endochondral bone formation.

[54244] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [54245] Yoshiura, K.-I.; Murray, J. C. : Sequence and chromosomal assignment of human BAPX1, a bagpipe-related gene, to 4p16.1: a candidate gene for skeletal dysplasia. *Genomics* 45: 425-428, 1997. ; and
- [54246] Tribioli, C.; Frasch, M.; Lufkin, T. : Bapx1: an evolutionary conserved homologue of the *Drosophila* bagpipe homeobox gene is expressed in splanchnic mesoderm and the embryonic skeleton.
- [54247] Further studies establishing the function and utilities of BAPX1 are found in John Hopkins OMIM database record ID 602183, and in cited publications numbered 8529-8531 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin D2 (CCND2, Accession NM\_001759) is another VGAM1591 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7517, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:4302.

[54248] Another function of VGAM1591 is therefore inhibition of Cyclin D2 (CCND2, Accession NM\_001759), a gene which is essential for the control of the cell cycle at the g1/s (start) transition. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM128.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA helicase, 54kDa) (DDX6, Accession NM\_004397) is another VGAM1591 host target gene. DDX6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DDX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX6 BINDING SITE, designated SEQ ID:10646, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54249] Another function of VGAM1591 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 6 (RNA

helicase, 54kDa) (DDX6, Accession NM\_004397), a gene which is putative RNA helicases. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX6. The function of DDX6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730) is another VGAM1591 host target gene. DNASE1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNASE1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNASE1L1 BINDING SITE, designated SEQ ID:13565, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54250] Another function of VGAM1591 is therefore inhibition of Deoxyribonuclease I-like 1 (DNASE1L1, Accession NM\_006730), a gene which seems to be involved in cell death. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with DNASE1L1. The function of DNASE1L1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM885. Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463) is another VGAM1591 host target gene. HNRPDL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPDL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPDL BINDING SITE, designated SEQ ID:11950, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54251] Another function of VGAM1591 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein D-like (HNRPDL, Accession NM\_005463), a gene which binds to rna molecules that contain au-rich elements. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPDL. The function of HNRPDL and its association with various diseases and clinical conditions, has been es-

established by previous studies, as described hereinabove with reference to VGAM144. Heat Shock 70kDa Protein 8 (HSPA8, Accession NM\_006597) is another VGAM1591 host target gene. HSPA8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPA8 BINDING SITE, designated SEQ ID:13370, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54252] Another function of VGAM1591 is therefore inhibition of Heat Shock 70kDa Protein 8 (HSPA8, Accession NM\_006597), a gene which acts as a chaperone. plays an important role in cells by transiently associating with nascent polypeptides to facilitate correct folding. Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPA8. The function of HSPA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM258. Thrombomodulin

(THBD, Accession NM\_000361) is another VGAM1591 host target gene. THBD BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by THBD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBD BINDING SITE, designated SEQ ID:5920, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54253] Another function of VGAM1591 is therefore inhibition of Thrombomodulin (THBD, Accession NM\_000361). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THBD. Chromosome 4 Open Reading Frame 6 (C4orf6, Accession NM\_005750) is another VGAM1591 host target gene. C4orf6 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C4orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C4orf6 BINDING SITE, designated SEQ ID:12310, to the nucleotide sequence of

VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54254] Another function of VGAM1591 is therefore inhibition of Chromosome 4 Open Reading Frame 6 (C4orf6, Accession NM\_005750). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C4orf6. HT002 (Accession NM\_014066) is another VGAM1591 host target gene. HT002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT002 BINDING SITE, designated SEQ ID:15283, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54255] Another function of VGAM1591 is therefore inhibition of HT002 (Accession NM\_014066). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT002. KIAA0775 (Accession NM\_014726) is another VGAM1591 host target gene. KIAA0775 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by KIAA0775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0775 BINDING SITE, designated SEQ ID:16319, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54256] Another function of VGAM1591 is therefore inhibition of KIAA0775 (Accession NM\_014726). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0775. KIAA0821 (Accession NM\_014921) is another VGAM1591 host target gene. KIAA0821 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0821 BINDING SITE, designated SEQ ID:17199, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54257] Another function of VGAM1591 is therefore inhibition of

KIAA0821 (Accession NM\_014921). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0821. KIAA1297 (Accession XM\_051005) is another VGAM1591 host target gene. KIAA1297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1297 BINDING SITE, designated SEQ ID:35713, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54258] Another function of VGAM1591 is therefore inhibition of KIAA1297 (Accession XM\_051005). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1297. MGC14161 (Accession NM\_032892) is another VGAM1591 host target gene. MGC14161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC14161 BINDING SITE, designated SEQ ID:26720, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54259] Another function of VGAM1591 is therefore inhibition of MGC14161 (Accession NM\_032892). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14161. MGC4161 (Accession NM\_024303) is another VGAM1591 host target gene. MGC4161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC4161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4161 BINDING SITE, designated SEQ ID:23595, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54260] Another function of VGAM1591 is therefore inhibition of MGC4161 (Accession NM\_024303). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4161. Proprotein Convertase Subtilisin/kexin Type 7

(PCSK7, Accession NM\_004716) is another VGAM1591 host target gene. PCSK7 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PCSK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK7 BINDING SITE, designated SEQ ID:11075, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54261] Another function of VGAM1591 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 7 (PCSK7, Accession NM\_004716). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK7. PRIC285 (Accession XM\_028918) is another VGAM1591 host target gene. PRIC285 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRIC285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRIC285 BINDING SITE, designated SEQ ID:30803, to the nucleotide sequence of VGAM1591 RNA,

herein designated VGAM RNA, also designated SEQ ID:4302.

[54262] Another function of VGAM1591 is therefore inhibition of PRIC285 (Accession XM\_028918). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRIC285. LOC135763 (Accession NM\_138572) is another VGAM1591 host target gene. LOC135763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135763 BINDING SITE, designated SEQ ID:28882, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54263] Another function of VGAM1591 is therefore inhibition of LOC135763 (Accession NM\_138572). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135763. LOC149464 (Accession XM\_097645) is another VGAM1591 host target gene. LOC149464 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC149464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149464 BINDING SITE, designated SEQ ID:40992, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54264] Another function of VGAM1591 is therefore inhibition of LOC149464 (Accession XM\_097645). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149464. LOC200531 (Accession XM\_114244) is another VGAM1591 host target gene. LOC200531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200531 BINDING SITE, designated SEQ ID:42818, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54265] Another function of VGAM1591 is therefore inhibition of LOC200531 (Accession XM\_114244). Accordingly, utilities

of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200531. LOC201689 (Accession XM\_040608) is another VGAM1591 host target gene. LOC201689 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201689, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201689 BINDING SITE, designated SEQ ID:33333, to the nucleotide sequence of VGAM1591 RNA, herein designated VGAM RNA, also designated SEQ ID:4302.

[54266] Another function of VGAM1591 is therefore inhibition of LOC201689 (Accession XM\_040608). Accordingly, utilities of VGAM1591 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201689. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1592 (VGAM1592) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54267] VGAM1592 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1592 was detected is described hereinabove with reference to Figs. 1–8.

[54268] VGAM1592 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3. VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54269] VGAM1592 gene encodes a VGAM1592 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1592 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1592 precursor RNA is designated SEQ ID:1578, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1578 is located at position 89710 relative to the genome of Ateline Herpesvirus 3.

[54270] VGAM1592 precursor RNA folds onto itself, forming VGAM1592 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54271] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1592 folded precursor RNA into VGAM1592 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1592 RNA is designated SEQ ID:4303, and is provided hereinbelow with reference to the sequence listing part.

[54272] VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1592 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[54273] VGAM1592 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1592 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1592 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54274] The complementary binding of VGAM1592 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1592 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1592 host target RNA into VGAM1592 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54275] It is appreciated that VGAM1592 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1592 host target genes. The mRNA of each one of this plurality of VGAM1592 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1592 RNA, herein designated VGAM RNA, and which when bound by VGAM1592 RNA causes inhibition of translation of respective one or more VGAM1592 host target proteins.

[54276] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1592 gene, herein designated VGAM GENE, on one or more VGAM1592 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54277] It is yet further appreciated that a function of VGAM1592 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1592 correlate with, and may be deduced from, the identity of the host target genes which VGAM1592 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54278] Nucleotide sequences of the VGAM1592 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1592 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1592 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1592 are further  
described hereinbelow with reference to Table 1.

[54279] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1592 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1592 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54280] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1592 gene, herein designated VGAM is  
inhibition of expression of VGAM1592 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1592 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1592  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54281] KIAA1560 (Accession XM\_034422) is a VGAM1592 host  
target gene. KIAA1560 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1560, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1560 BINDING SITE, designated SEQ ID:32102, to the nucleotide sequence of VGAM1592 RNA, herein designated VGAM RNA, also designated SEQ ID:4303.

[54282] A function of VGAM1592 is therefore inhibition of KIAA1560 (Accession XM\_034422). Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1560. LANO (Accession NM\_025168) is another VGAM1592 host target gene. LANO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANO BINDING SITE, designated SEQ ID:24805, to the nucleotide sequence of VGAM1592 RNA, herein designated VGAM RNA, also designated SEQ ID:4303.

[54283] Another function of VGAM1592 is therefore inhibition of

LANO (Accession NM\_025168). Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANO. Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055) is another VGAM1592 host target gene. ROBO4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROBO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO4 BINDING SITE, designated SEQ ID:21133, to the nucleotide sequence of VGAM1592 RNA, herein designated VGAM RNA, also designated SEQ ID:4303.

[54284] Another function of VGAM1592 is therefore inhibition of Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055). Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO4. Unc-51-like Kinase 2 (C. elegans) (ULK2, Accession NM\_014683) is another VGAM1592 host target gene. ULK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ULK2,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ULK2 BINDING SITE, designated SEQ ID:16183, to the nucleotide sequence of VGAM1592 RNA, herein designated VGAM RNA, also designated SEQ ID:4303.

[54285] Another function of VGAM1592 is therefore inhibition of Unc-51-like Kinase 2 (*C. elegans*) (ULK2, Accession NM\_014683). Accordingly, utilities of VGAM1592 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ULK2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1593 (VGAM1593) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54286] VGAM1593 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1593 was detected is described hereinabove with reference to Figs. 1–8.

[54287] VGAM1593 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Ateline Herpesvirus 3.

VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54288] VGAM1593 gene encodes a VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1593 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1593 precursor RNA is designated SEQ ID:1579, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1579 is located at position 86183 relative to the genome of Ateline Herpesvirus 3.

[54289] VGAM1593 precursor RNA folds onto itself, forming VGAM1593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54290] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1593 folded precursor RNA into VGAM1593 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM1593 RNA is designated SEQ ID:4304, and is provided hereinbelow with reference to the sequence listing part.

[54291] VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1593 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54292] VGAM1593 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1593 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1593 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54293] The complementary binding of VGAM1593 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1593 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1593 host target RNA into VGAM1593 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54294] It is appreciated that VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1593 host target genes. The mRNA of each one of this plurality of VGAM1593 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1593 RNA, herein designated VGAM RNA, and which when bound by VGAM1593 RNA causes inhibition of translation of respective one or more VGAM1593 host target proteins.

[54295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1593 gene, herein designated VGAM GENE, on one or more VGAM1593 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54296] It is yet further appreciated that a function of VGAM1593 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of viral infection by Ateline Herpesvirus 3. Specific functions, and accordingly utilities, of VGAM1593 correlate with, and may be deduced from, the identity of the host target genes which VGAM1593 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54297] Nucleotide sequences of the VGAM1593 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1593 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1593 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1593 are further described hereinbelow with reference to Table 1.

[54298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1593 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1593 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54299] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1593 gene, herein designated VGAM is inhibition of expression of VGAM1593 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1593 correlate with, and may be deduced from, the identity of the target genes which VGAM1593 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54300] ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052) is a VGAM1593 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE,

designated SEQ ID:5493, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54301] A function of VGAM1593 is therefore inhibition of ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Faciogenital Dysplasia (Aarskog-Scott syndrome) (FGD1, Accession NM\_004463) is another VGAM1593 host target gene. FGD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGD1 BINDING SITE, designated SEQ ID:10768, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54302] Another function of VGAM1593 is therefore inhibition of Faciogenital Dysplasia (Aarskog-Scott syndrome) (FGD1, Accession NM\_004463), a gene which activates the ras-like family of rho- and rac proteins by exchanging bound

gdp for free gtp. Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGD1. The function of FGD1 has been established by previous studies. Aarskog (1970) described an X-linked disorder characterized by ocular hypertelorism, anteverted nostrils, broad upper lip, and peculiar penoscrotal relations ('saddle-bag scrotum' or 'shawl scrotum'). Affected males can reproduce. Scott (1971) emphasized the occurrence of ligamentous laxity manifest by hyperextensibility of the fingers, genu recurvatum, and flat feet. Furthermore, hypermobility in the cervical spine with anomaly of the odontoid resulted in neurologic deficit. He studied a family with 9 affected males in 5 sibships. Sugarman et al. (1973) described a kindred with 4 affected males. They emphasized the occurrence of a 'peculiar curved linear dimple inferior to the lower lip.' This and other stigmata were present in an earlier female. They favored sex-influenced autosomal dominant inheritance. Escobar and Weaver (1978) reported a patient who had features more suggestive of the Noonan syndrome than of the Aarskog syndrome. The patient, aged 28 years, also had severe macrocytic anemia refractory to iron therapy, hepatomegaly, hemochromatosis,

portal cirrhosis, and interstitial pulmonary disease. Tyrkus et al. (1980) described mother and son with Aarskog–Scott syndrome. Expression was complete in the mother. The mother and son had a reciprocal translocation between the X chromosome and chromosome 8. The breakpoint on the X was at Xq12. The mother's parents and sibs were clinically normal and the parents had normal karyotypes. Tyrkus et al. (1980) described parental exposure to ionizing radiation. They found that the Aarskog–Scott locus may be located at Xq12. The normal X chromosome in the mother was consistently inactivated. Thus the full expression in the mother was explained. Bawle et al. (1984) published definitively on the family in which a balanced X–autosome translocation was associated with Aarskog syndrome in mother and son. They placed the X chromosome breakpoint at Xq13. Noteworthy was the full expression in the mother comparable to the full expression of Duchenne muscular dystrophy (OMIM Ref. No. 310200) in women with balanced X–autosome translocations involving Xp21. The authors postulated that, as in the latter case, the break at Xq13 creating the translocation also caused a presumed de novo point mutation in the 'Aarskog gene' and that the woman had nonrandom

(preferential) inactivation of her structurally normal X. By high resolution cytogenetic studies, Rafael et al. (1992) demonstrated that the X chromosome breakpoint in the patient of Bawle et al. (1984) was located in the proximal short arm of the X chromosome rather than at Xq13. The autosomal breakpoint was 8q11 rather than 8p21.1, as previously reported. By study of somatic cell hybrids containing the der(X) chromosome by a combination of fluorescence in situ hybridization and Southern blot analysis with X-chromosome probes, Glover et al. (1993) refined the localization of the breakpoint to Xp11.21. Orrico et al. (2000) analyzed 13 unrelated patients with the clinical diagnosis of Aarskog–Scott syndrome. One patient carried an arg610-to-gln mutation (305400.0002) located in 1 of the 2 pleckstrin homology (PH) domains of the FGD1 gene. It corresponded to a highly conserved residue that had been involved in phosphoinositide binding in PH domains of other proteins. Critical missense mutations within the PH domain of the Bruton tyrosine kinase gene (BTK; 300300) result in X-linked agammaglobulinemia. Using SSCP analysis of the FGD1 gene, Schwartz et al. (2000) identified a missense mutation (305400.0003) in a familial case of Aarskog–Scott syndrome and a deletion

mutation (305400.0004) in a sporadic case. The authors were unable to detect alterations in the FGD1 gene in probands from 25 other familial cases, including the families originally described by Aarskog (1970) and Scott (1971), or in 15 sporadic cases. They suggested that mutational mechanisms not detected using standard analysis of coding sequence genomic DNA may cause the disorder.

[54303] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

M.; Musacchio, A.; Sorrentino, V. : A mutation in the pleckstrin homology (PH) domain of the FGD1 gene in an Italian family with faciogenital dysplasia (Aarskog–Scott syndrome). *FEBS Lett.* 478: 216–220, 2000. ; and

[54305] Schwartz, C. E.; Gillesen–Kaesbach, G.; May, M.; Cappa, M.; Gorski, J.; Steindl, K.; Neri, G. : Two novel mutations confirm FGD1 is responsible for the Aarskog syndrome. *Europ. J. Hum.*

[54306] Further studies establishing the function and utilities of FGD1 are found in John Hopkins OMIM database record ID 305400, and in cited publications numbered

10641–10644, 10966–10646, 3258, 10967–10648, 3259, 10649–10656, 10968–1067 and 10822–10826 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PAG (Accession NM\_018440) is another VGAM1593 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:20510, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54307] Another function of VGAM1593 is therefore inhibition of PAG (Accession NM\_018440). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM\_003032) is another VGAM1593 host target gene. SIAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:8976, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54308] Another function of VGAM1593 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM\_003032), a gene which transfers sialic acid from the donor of substrate cmp- sialic acid to galactose containing acceptor substrates. Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1. The function of SIAT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1224. Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM\_015394) is another VGAM1593 host target gene. ZNF10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ZNF10 BINDING SITE, designated SEQ ID:17696, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54309] Another function of VGAM1593 is therefore inhibition of Zinc Finger Protein 10 (KOX 1) (ZNF10, Accession NM\_015394), a gene which may function as a transcriptional regulator. Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF10. The function of ZNF10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM36. Calneuron 1 (CALN1, Accession NM\_031468) is another VGAM1593 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25518, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54310] Another function of VGAM1593 is therefore inhibition of

Calneuron 1 (CALN1, Accession NM\_031468). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. Cathepsin O (CTSO, Accession NM\_001334) is another VGAM1593 host target gene. CTSO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTSO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTSO BINDING SITE, designated SEQ ID:7017, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54311] Another function of VGAM1593 is therefore inhibition of Cathepsin O (CTSO, Accession NM\_001334). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTSO. FLJ21106 (Accession NM\_025097) is another VGAM1593 host target gene. FLJ21106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ21106 BINDING SITE, designated SEQ ID:24737, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54312] Another function of VGAM1593 is therefore inhibition of FLJ21106 (Accession NM\_025097). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21106. M96 (Accession NM\_007358) is another VGAM1593 host target gene. M96 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by M96, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of M96 BINDING SITE, designated SEQ ID:14289, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54313] Another function of VGAM1593 is therefore inhibition of M96 (Accession NM\_007358). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with M96. PRO1843 (Accession NM\_018507) is another VGAM1593

host target gene. PRO1843 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1843 BINDING SITE, designated SEQ ID:20575, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54314] Another function of VGAM1593 is therefore inhibition of PRO1843 (Accession NM\_018507). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1843. PRO2958 (Accession NM\_018546) is another VGAM1593 host target gene. PRO2958 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2958 BINDING SITE, designated SEQ ID:20628, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54315] Another function of VGAM1593 is therefore inhibition of PRO2958 (Accession NM\_018546). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2958. LOC129676 (Accession XM\_065341) is another VGAM1593 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37290, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54316] Another function of VGAM1593 is therefore inhibition of LOC129676 (Accession XM\_065341). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC131583 (Accession XM\_067456) is another VGAM1593 host target gene. LOC131583 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC131583, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131583 BINDING SITE, designated SEQ ID:37357, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54317] Another function of VGAM1593 is therefore inhibition of LOC131583 (Accession XM\_067456). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131583. LOC91291 (Accession XM\_037478) is another VGAM1593 host target gene. LOC91291 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91291, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91291 BINDING SITE, designated SEQ ID:32632, to the nucleotide sequence of VGAM1593 RNA, herein designated VGAM RNA, also designated SEQ ID:4304.

[54318] Another function of VGAM1593 is therefore inhibition of LOC91291 (Accession XM\_037478). Accordingly, utilities of VGAM1593 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91291. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1594 (VGAM1594) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54319] VGAM1594 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1594 was detected is described hereinabove with reference to Figs. 1–8.

[54320] VGAM1594 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek Yellow Stripe Potyvirus. VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54321] VGAM1594 gene encodes a VGAM1594 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1594 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1594 precursor RNA is designated SEQ ID:1580, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1580 is located at position 10003 relative to the genome of Leek Yellow Stripe Potyvirus.

- [54322] VGAM1594 precursor RNA folds onto itself, forming VGAM1594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54323] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1594 folded precursor RNA into VGAM1594 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM1594 RNA is designated SEQ ID:4305, and is provided hereinbelow with reference to the sequence listing part.

[54324] VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1594 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54325] VGAM1594 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1594 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1594 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54326] The complementary binding of VGAM1594 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1594 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1594 host target RNA into VGAM1594 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54327] It is appreciated that VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1594 host target genes. The mRNA of each one of this plurality of VGAM1594 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1594 RNA, herein designated VGAM RNA, and which when bound by VGAM1594 RNA causes

inhibition of translation of respective one or more VGAM1594 host target proteins.

[54328] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1594 gene, herein designated VGAM GENE, on one or more VGAM1594 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54329] It is yet further appreciated that a function of VGAM1594 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1594 include diagnosis, prevention and

treatment of viral infection by Leek Yellow Stripe Potyvirus. Specific functions, and accordingly utilities, of VGAM1594 correlate with, and may be deduced from, the identity of the host target genes which VGAM1594 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54330] Nucleotide sequences of the VGAM1594 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1594 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1594 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1594 are further described hereinbelow with reference to Table 1.

[54331] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1594 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1594 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54332] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1594 gene, herein designated VGAM is inhibition of expression of VGAM1594 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1594 correlate with, and may be deduced from, the identity of the target genes which VGAM1594 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54333] Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030667) is a VGAM1594 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE5, designated SEQ ID:25001, SEQ ID:25025, SEQ ID:25016, SEQ ID:8736 and SEQ ID:25007 respectively, to the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, also designated SEQ ID:4305.

[54334] A function of VGAM1594 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030667), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1594 include diagno-

sis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM140. Peptidoglycan Recognition Protein (PGLYRP, Accession NM\_052890) is another VGAM1594 host target gene. PGLYRP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGLYRP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGLYRP BINDING SITE, designated SEQ ID:27480, to the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, also designated SEQ ID:4305.

[54335] Another function of VGAM1594 is therefore inhibition of Peptidoglycan Recognition Protein (PGLYRP, Accession NM\_052890). Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGLYRP. Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792) is another VGAM1594 host target

gene. PTPNS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPNS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPNS1 BINDING SITE, designated SEQ ID:28051, to the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, also designated SEQ ID:4305.

[54336] Another function of VGAM1594 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type Substrate 1 (PTPNS1, Accession NM\_080792). Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPNS1. LOC146540 (Accession XM\_085497) is another VGAM1594 host target gene. LOC146540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146540 BINDING SITE, designated SEQ ID:38200, to the nucleotide sequence of VGAM1594 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4305.

[54337] Another function of VGAM1594 is therefore inhibition of LOC146540 (Accession XM\_085497). Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146540. LOC162333 (Accession XM\_102591) is another VGAM1594 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42134, to the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, also designated SEQ ID:4305.

[54338] Another function of VGAM1594 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC92597 (Accession XM\_046066) is another VGAM1594 host target gene. LOC92597 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92597, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92597 BINDING SITE, designated SEQ ID:34672, to the nucleotide sequence of VGAM1594 RNA, herein designated VGAM RNA, also designated SEQ ID:4305.

[54339] Another function of VGAM1594 is therefore inhibition of LOC92597 (Accession XM\_046066). Accordingly, utilities of VGAM1594 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92597. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1595 (VGAM1595) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54340] VGAM1595 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1595 was detected is described hereinabove with reference to Figs. 1-8.

[54341] VGAM1595 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek Yellow Stripe Po-

tyvirus. VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54342] VGAM1595 gene encodes a VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1595 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1595 precursor RNA is designated SEQ ID:1581, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1581 is located at position 6252 relative to the genome of Leek Yellow Stripe Potyvirus.

[54343] VGAM1595 precursor RNA folds onto itself, forming VGAM1595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54344] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1595 folded precursor RNA into VGAM1595 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1595 RNA is designated SEQ ID:4306, and is provided hereinbelow with reference to the sequence listing part.

[54345] VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1595 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54346] VGAM1595 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1595 RNA is an accurate or a partial inversed–reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1595 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54347] The complementary binding of VGAM1595 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1595 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1595 host target RNA into VGAM1595 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54348] It is appreciated that VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1595 host target genes. The mRNA of each one of this plurality of VGAM1595 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1595 RNA, herein designated VGAM RNA, and which when bound by VGAM1595 RNA causes inhibition of translation of respective one or more VGAM1595 host target proteins.

[54349] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1595 gene, herein designated VGAM GENE, on one or more VGAM1595 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54350] It is yet further appreciated that a function of VGAM1595 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of viral infection by Leek Yellow Stripe Potyvirus. Specific functions, and accordingly utilities, of VGAM1595 correlate with, and may be deduced from, the identity of the host target genes which VGAM1595 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54351] Nucleotide sequences of the VGAM1595 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1595 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1595 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1595 are further described hereinbelow with reference to Table 1.

[54352] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1595 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1595 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54353] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1595 gene, herein designated VGAM is inhibition of expression of VGAM1595 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1595 correlate with, and may be deduced from, the identity of the target genes which VGAM1595 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54354] Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927) is a VGAM1595 host target gene. FHOD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHOD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHOD2 BINDING SITE, designated SEQ

ID:36552, to the nucleotide sequence of VGAM1595 RNA, herein designated VGAM RNA, also designated SEQ ID:4306.

[54355] A function of VGAM1595 is therefore inhibition of Formin Homology 2 Domain Containing 2 (FHOD2, Accession XM\_057927). Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHOD2. Protocadherin 19 (PCDH19, Accession XM\_033173) is another VGAM1595 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31861, to the nucleotide sequence of VGAM1595 RNA, herein designated VGAM RNA, also designated SEQ ID:4306.

[54356] Another function of VGAM1595 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM\_033173). Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. LOC124222 (Accession

XM\_058784) is another VGAM1595 host target gene.

LOC124222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124222 BINDING SITE, designated SEQ ID:36740, to the nucleotide sequence of VGAM1595 RNA, herein designated VGAM RNA, also designated SEQ ID:4306.

[54357] Another function of VGAM1595 is therefore inhibition of LOC124222 (Accession XM\_058784). Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124222. LOC195977 (Accession XM\_113625) is another VGAM1595 host target gene. LOC195977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC195977, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC195977 BINDING SITE, designated SEQ ID:42298, to the nucleotide sequence of VGAM1595 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4306.

[54358] Another function of VGAM1595 is therefore inhibition of LOC195977 (Accession XM\_113625). Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC195977. LOC202134 (Accession XM\_117365) is another VGAM1595 host target gene. LOC202134 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202134 BINDING SITE, designated SEQ ID:43413, to the nucleotide sequence of VGAM1595 RNA, herein designated VGAM RNA, also designated SEQ ID:4306.

[54359] Another function of VGAM1595 is therefore inhibition of LOC202134 (Accession XM\_117365). Accordingly, utilities of VGAM1595 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202134. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1596 (VGAM1596) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54360] VGAM1596 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1596 was detected is described hereinabove with reference to Figs. 1–8.

[54361] VGAM1596 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek Yellow Stripe Potyvirus. VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54362] VGAM1596 gene encodes a VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1596 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1596 precursor RNA is designated SEQ ID:1582, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1582 is located at position 3823 relative to the genome of Leek Yellow Stripe Potyvirus.

[54363] VGAM1596 precursor RNA folds onto itself, forming

VGAM1596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54364] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1596 folded precursor RNA into VGAM1596 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1596 RNA is designated SEQ ID:4307, and is provided hereinbelow with reference to the sequence listing part.

[54365] VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1596 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54366] VGAM1596 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1596 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1596 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54367] The complementary binding of VGAM1596 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1596 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1596 host target RNA into VGAM1596 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54368] It is appreciated that VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1596 host target genes. The mRNA of each one of this plurality of VGAM1596 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1596 RNA, herein designated VGAM RNA, and which when bound by VGAM1596 RNA causes inhibition of translation of respective one or more VGAM1596 host target proteins.

[54369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1596 gene, herein designated VGAM GENE, on one or more VGAM1596 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54370] It is yet further appreciated that a function of VGAM1596 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of viral infection by Leek Yellow Stripe Potyvirus. Specific functions, and accordingly utilities, of VGAM1596 correlate with, and may be deduced from, the identity of the host target genes which VGAM1596 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54371] Nucleotide sequences of the VGAM1596 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1596 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1596 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1596 are further described hereinbelow with reference to Table 1.

[54372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1596 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1596 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54373] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1596 gene, herein designated VGAM is inhibition of expression of VGAM1596 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1596 correlate with, and may be deduced from, the identity of the target genes which VGAM1596 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[54374] Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398) is a VGAM1596 host target gene. DLG5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DLG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLG5 BINDING SITE, designated SEQ ID:40340, to the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, also designated SEQ ID:4307.

[54375] A function of VGAM1596 is therefore inhibition of Discs, Large (Drosophila) Homolog 5 (DLG5, Accession XM\_096398), a gene which may transmit extracellular signals to inhibit cell proliferation. Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLG5. The function of DLG5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM444. Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Accession NM\_001991) is another VGAM1596 host target gene. EZH1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by EZH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZH1 BINDING SITE, designated SEQ ID:7716, to the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, also designated SEQ ID:4307.

[54376] Another function of VGAM1596 is therefore inhibition of Enhancer of Zeste Homolog 1 (Drosophila) (EZH1, Accession NM\_001991), a gene which may act in transcriptional regulation and heterochromatin maintenance. Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZH1. The function of EZH1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM251. Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM\_001080) is another VGAM1596 host target gene. ALDH5A1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ALDH5A1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH5A1 BINDING SITE, designated SEQ ID:6741, to the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, also designated SEQ ID:4307.

[54377] Another function of VGAM1596 is therefore inhibition of Aldehyde Dehydrogenase 5 Family, Member A1 (succinate-semialdehyde dehydrogenase) (ALDH5A1, Accession NM\_001080). Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH5A1. Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331) is another VGAM1596 host target gene. C20orf121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf121 BINDING SITE, designated SEQ ID:23635, to the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, also designated SEQ ID:4307.

[54378] Another function of VGAM1596 is therefore inhibition of Chromosome 20 Open Reading Frame 121 (C20orf121, Accession NM\_024331). Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf121. Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832) is another VGAM1596 host target gene. SLC26A7 BINDING SITE1 and SLC26A7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SLC26A7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC26A7 BINDING SITE1 and SLC26A7 BINDING SITE2, designated SEQ ID:27412 and SEQ ID:28624 respectively, to the nucleotide sequence of VGAM1596 RNA, herein designated VGAM RNA, also designated SEQ ID:4307.

[54379] Another function of VGAM1596 is therefore inhibition of Solute Carrier Family 26, Member 7 (SLC26A7, Accession NM\_052832). Accordingly, utilities of VGAM1596 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC26A7. Fig. 1 further provides a conceptual description of a novel bioinformati-

cally detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1597 (VGAM1597) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54380] VGAM1597 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1597 was detected is described hereinabove with reference to Figs. 1–8.

[54381] VGAM1597 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Leek Yellow Stripe Potyvirus. VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54382] VGAM1597 gene encodes a VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1597 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1597 precursor RNA is designated SEQ ID:1583, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1583 is located at position 5446 relative to the

genome of Leek Yellow Stripe Potyvirus.

[54383] VGAM1597 precursor RNA folds onto itself, forming VGAM1597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54384] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1597 folded precursor RNA into VGAM1597 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM1597 RNA is designated SEQ ID:4308, and is provided hereinbelow with reference to the sequence listing part.

[54385] VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1597 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54386] VGAM1597 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1597 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1597 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54387] The complementary binding of VGAM1597 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1597 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1597 host target RNA into VGAM1597 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54388] It is appreciated that VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1597 host target genes. The mRNA of each one of this plurality of VGAM1597 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1597 RNA, herein designated VGAM RNA, and which when bound by VGAM1597 RNA causes inhibition of translation of respective one or more VGAM1597 host target proteins.

[54389] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1597 gene, herein designated VGAM GENE, on one or more VGAM1597 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54390] It is yet further appreciated that a function of VGAM1597 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of viral infection by Leek Yellow Stripe Potyvirus. Specific functions, and accordingly utilities, of

VGAM1597 correlate with, and may be deduced from, the identity of the host target genes which VGAM1597 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54391] Nucleotide sequences of the VGAM1597 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1597 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1597 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1597 are further described hereinbelow with reference to Table 1.

[54392] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1597 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1597 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54393] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1597 gene, herein designated VGAM is inhibition of expression of VGAM1597 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1597 correlate with, and may be deduced

from, the identity of the target genes which VGAM1597 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54394] Casein Kinase 2, Alpha 1 Polypeptide (CSNK2A1, Accession NM\_001895) is a VGAM1597 host target gene. CSNK2A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSNK2A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK2A1 BINDING SITE, designated SEQ ID:7621, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54395] A function of VGAM1597 is therefore inhibition of Casein Kinase 2, Alpha 1 Polypeptide (CSNK2A1, Accession NM\_001895), a gene which cphosphorylates acidic protein such as casein. Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK2A1. The function of CSNK2A1 has been established by previous studies. Phosphorylation of the human p53 protein (OMIM Ref. No. 191170) at ser392 is responsive to ultraviolet (UV) but not

gamma irradiation. Keller et al. (2001) identified and purified a mammalian UV-activated protein kinase complex that phosphorylates ser392 in vitro. This kinase complex contains CK2 and the chromatin transcriptional elongation factor FACT, a heterodimer of SPT16 (OMIM Ref. No. 605012) and SSRP1 (OMIM Ref. No. 604328). In vitro studies showed that FACT alters the specificity of CK2 in the complex such that it selectively phosphorylates p53 over other substrates, including casein. In addition, phosphorylation by the kinase complex was found to enhance p53 activity. These results provided a potential mechanism for p53 activation by UV irradiation Doray et al. (2002) demonstrated that the Golgi-localized, gamma-ear-containing adenosine diphosphate ribosylation factor-binding proteins (GGA1, 606004 and GGA3, 606006) and the coat protein adaptor protein-1 (AP-1) complex (see OMIM Ref. No. AP1G2, 603534) colocalize in clathrin-coated buds of the trans-Golgi networks of mouse L cells and human HeLa cells. Binding studies revealed a direct interaction between the hinge domains of the GGAs and the gamma-ear domain of AP-1. Further, AP-1 contained bound casein kinase-2 that phosphorylated GGA1 and GGA3, thereby causing autoinhibition. Doray et al. (2002)

demonstrated that this autoinhibition could induce the directed transfer of mannose 6-phosphate receptors (see OMIM Ref. No. 154540) from the GGAs to AP-1. Mannose 6-phosphate receptors that were defective in binding to GGAs were poorly incorporated into adaptor protein complex containing clathrin coated vesicles. Thus, Doray et al. (2002) concluded that GGAs and the AP-1 complex interact to package mannose 6-phosphate receptors into AP-1-containing coated vesicles

[54396] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54398] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP-1 in packaging MPRs at the trans-Golgi network. *Science* 297: 1700-1703, 2002.

[54399] Further studies establishing the function and utilities of CSNK2A1 are found in John Hopkins OMIM database record ID 115440, and in cited publications numbered 12595-12596, 1035 and 12597-12600 listed in the bibli-

ography section hereinbelow, which are also hereby incorporated by reference. SORCS1 (Accession NM\_052918) is another VGAM1597 host target gene. SORCS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:27484, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54400] Another function of VGAM1597 is therefore inhibition of SORCS1 (Accession NM\_052918). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. DKFZP564O0423 (Accession XM\_166254) is another VGAM1597 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE,

designated SEQ ID:44065, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54401] Another function of VGAM1597 is therefore inhibition of DKFZP564O0423 (Accession XM\_166254). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. DKFZP586J0619 (Accession XM\_088280) is another VGAM1597 host target gene. DKFZP586J0619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586J0619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586J0619 BINDING SITE, designated SEQ ID:39581, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54402] Another function of VGAM1597 is therefore inhibition of DKFZP586J0619 (Accession XM\_088280). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586J0619. GFR (Accession NM\_012294) is an-

other VGAM1597 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:14637, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54403] Another function of VGAM1597 is therefore inhibition of GFR (Accession NM\_012294). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA0429 (Accession NM\_014751) is another VGAM1597 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16466, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54404] Another function of VGAM1597 is therefore inhibition of KIAA0429 (Accession NM\_014751). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. MGC11115 (Accession NM\_032310) is another VGAM1597 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:26093, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54405] Another function of VGAM1597 is therefore inhibition of MGC11115 (Accession NM\_032310). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. LOC151391 (Accession XM\_098050) is another VGAM1597 host target gene. LOC151391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151391, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151391 BINDING SITE, designated SEQ ID:41336, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54406] Another function of VGAM1597 is therefore inhibition of LOC151391 (Accession XM\_098050). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151391. LOC163882 (Accession XM\_089211) is another VGAM1597 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39972, to the nucleotide sequence of VGAM1597 RNA, herein designated VGAM RNA, also designated SEQ ID:4308.

[54407] Another function of VGAM1597 is therefore inhibition of LOC163882 (Accession XM\_089211). Accordingly, utilities of VGAM1597 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1598 (VGAM1598) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54408] VGAM1598 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1598 was detected is described hereinabove with reference to Figs. 1–8.

[54409] VGAM1598 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54410] VGAM1598 gene encodes a VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1598 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1598 precursor RNA is designated SEQ ID:1584, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1584 is located at position 32869 relative to the genome of Human Adenovirus E.

- [54411] VGAM1598 precursor RNA folds onto itself, forming VGAM1598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54412] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1598 folded precursor RNA into VGAM1598 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1598 RNA is designated SEQ ID:4309, and is provided hereinbelow with reference to the sequence listing part.

[54413] VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1598 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54414] VGAM1598 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1598 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1598 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54415] The complementary binding of VGAM1598 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1598 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1598 host target RNA into VGAM1598 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54416] It is appreciated that VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1598 host target genes. The mRNA of each one of this plurality of VGAM1598 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1598 RNA, herein designated VGAM RNA, and which when bound by VGAM1598 RNA causes

inhibition of translation of respective one or more VGAM1598 host target proteins.

[54417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1598 gene, herein designated VGAM GENE, on one or more VGAM1598 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54418] It is yet further appreciated that a function of VGAM1598 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1598 include diagnosis, prevention and

treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM1598 correlate with, and may be deduced from, the identity of the host target genes which VGAM1598 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54419] Nucleotide sequences of the VGAM1598 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1598 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1598 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1598 are further described hereinbelow with reference to Table 1.

[54420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1598 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1598 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54421] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1598 gene, herein designated VGAM is inhibition of expression of VGAM1598 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1598 correlate with, and may be deduced from, the identity of the target genes which VGAM1598 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54422] Sperm Associated Antigen 8 (SPAG8, Accession NM\_012436) is a VGAM1598 host target gene. SPAG8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAG8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAG8 BINDING SITE, designated SEQ ID:14816, to the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, also designated SEQ ID:4309.

[54423] A function of VGAM1598 is therefore inhibition of Sperm Associated Antigen 8 (SPAG8, Accession NM\_012436), a gene which is a Sperm plasma membrane antigens are attractive antifertility vaccine targets. Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAG8. The function of SPAG8 and its association with various diseases and clinical conditions, has been estab-

lished by previous studies, as described hereinabove with reference to VGAM129.KIAA0471 (Accession NM\_014857) is another VGAM1598 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16912, to the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, also designated SEQ ID:4309.

[54424] Another function of VGAM1598 is therefore inhibition of KIAA0471 (Accession NM\_014857). Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. RAB35, Member RAS Oncogene Family (RAB35, Accession NM\_006861) is another VGAM1598 host target gene. RAB35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB35 BINDING SITE, designated SEQ

ID:13731, to the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, also designated SEQ ID:4309.

[54425] Another function of VGAM1598 is therefore inhibition of RAB35, Member RAS Oncogene Family (RAB35, Accession NM\_006861). Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB35. LOC129138 (Accession NM\_138797) is another VGAM1598 host target gene. LOC129138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129138 BINDING SITE, designated SEQ ID:29018, to the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, also designated SEQ ID:4309.

[54426] Another function of VGAM1598 is therefore inhibition of LOC129138 (Accession NM\_138797). Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129138. LOC164955 (Accession XM\_092265) is an-

other VGAM1598 host target gene. LOC164955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164955 BINDING SITE, designated SEQ ID:40112, to the nucleotide sequence of VGAM1598 RNA, herein designated VGAM RNA, also designated SEQ ID:4309.

[54427] Another function of VGAM1598 is therefore inhibition of LOC164955 (Accession XM\_092265). Accordingly, utilities of VGAM1598 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164955. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1599 (VGAM1599) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54428] VGAM1599 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1599 was detected is de-

scribed hereinabove with reference to Figs. 1–8.

[54429] VGAM1599 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54430] VGAM1599 gene encodes a VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1599 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1599 precursor RNA is designated SEQ ID:1585, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1585 is located at position 24788 relative to the genome of Human Adenovirus E.

[54431] VGAM1599 precursor RNA folds onto itself, forming VGAM1599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA

gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54432] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1599 folded precursor RNA into VGAM1599 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1599 RNA is designated SEQ ID:4310, and is provided hereinbelow with reference to the sequence listing part.

[54433] VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1599 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54434] VGAM1599 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites

located in untranslated regions of VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1599 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1599 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1599 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54435] The complementary binding of VGAM1599 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1599 host target RNA, herein designated VGAM

HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1599 host target RNA into VGAM1599 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54436] It is appreciated that VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1599 host target genes. The mRNA of each one of this plurality of VGAM1599 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1599 RNA, herein designated VGAM RNA, and which when bound by VGAM1599 RNA causes inhibition of translation of respective one or more VGAM1599 host target proteins.

[54437] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1599 gene, herein designated VGAM GENE, on one or more VGAM1599 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54438] It is yet further appreciated that a function of VGAM1599 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM1599 correlate with, and may be deduced from, the identity of the host target genes which VGAM1599 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54439] Nucleotide sequences of the VGAM1599 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1599 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM1599 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1599 are further described hereinbelow with reference to Table 1.

[54440] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1599 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1599 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54441] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1599 gene, herein designated VGAM is inhibition of expression of VGAM1599 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1599 correlate with, and may be deduced from, the identity of the target genes which VGAM1599 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54442] Ankyrin 2, Neuronal (ANK2, Accession NM\_001148) is a VGAM1599 host target gene. ANK2 BINDING SITE1 and ANK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANK2, corresponding to HOST TARGET binding sites such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK2 BINDING SITE1 and ANK2 BINDING SITE2, designated SEQ ID:6822 and SEQ ID:21966 respectively, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54443] A function of VGAM1599 is therefore inhibition of Ankyrin 2, Neuronal (ANK2, Accession NM\_001148), a gene which attaches integral membrane proteins to cytoskeletal elements. also binds to cytoskeletal proteins. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK2. The function of ANK2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM769. Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM\_028642) is another VGAM1599 host target gene. ITGA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

ITGA5 BINDING SITE, designated SEQ ID:30721, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54444] Another function of VGAM1599 is therefore inhibition of Integrin, Alpha 5 (fibronectin receptor, alpha polypeptide) (ITGA5, Accession XM\_028642), a gene which is receptor for fibronectin and fibrinogen and recognizes the sequence r-g-d in its ligands. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGA5. The function of ITGA5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1220. Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM\_000890) is another VGAM1599 host target gene. KCNJ5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ5 BINDING SITE, designated SEQ ID:6586, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA,

also designated SEQ ID:4310.

[54445] Another function of VGAM1599 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 5 (KCNJ5, Accession NM\_000890), a gene which is a potassium inwardly-rectifying channel. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ5. The function of KCNJ5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM766. Leptin (obesity homolog, mouse) (LEP, Accession NM\_000230) is another VGAM1599 host target gene. LEP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEP BINDING SITE, designated SEQ ID:5735, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54446] Another function of VGAM1599 is therefore inhibition of Leptin (obesity homolog, mouse) (LEP, Accession

NM\_000230). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEP. MutS Homolog 3 (E. coli) (MSH3, Accession NM\_002439) is another VGAM1599 host target gene. MSH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSH3 BINDING SITE, designated SEQ ID:8282, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54447] Another function of VGAM1599 is therefore inhibition of MutS Homolog 3 (E. coli) (MSH3, Accession NM\_002439), a gene which belongs to the dna mismatch repair muts family. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSH3. The function of MSH3 has been established by previous studies. Akiyama et al. (1997) screened for somatic mutations of the MSH3 (A)<sub>8</sub> repeat in 29 tumors from 23 hereditary nonpolyposis colorectal cancer patients. One or 2 A deletions in the (A)<sub>8</sub>

repeat were found in 11 (57.9%) of the 19 tumors that showed microsatellite instability (MI) but not in 10 MI-negative ones, indicating secondary mutations after germline mutations of other mismatch repair genes. Moreover, the MI frequency of 3 or more nucleotide repeats was higher in MSH3 (A)8-mutated tumor cells than in nonmutated ones. Their data suggested that a mutation of a mismatch repair gene enhances the frequency of another mismatch repair gene mutation, such as of MSH3, resulting in severe microsatellite instability. Yin et al. (1997) came to a similar conclusion: that DNA mismatch repair genes, such as MSH3 and MSH6 (OMIM Ref. No. 600678), are targets for the mutagenic activity of upstream mismatch repair gene mutations and that this enhanced genomic instability may accelerate the accumulation of mutations in replication/repair error positive tumors. Animal model experiments lend further support to the function of MSH3. De Wind et al. (1999) inactivated the mouse Msh3 and Msh6 genes by targeted disruption. Msh6-deficient mice were prone to cancer. Most animals developed lymphomas or epithelial tumors originating from the skin and uterus but only rarely from the intestine. Msh3 deficiency did not cause cancer predisposition,

but in an Msh6-deficient background, loss of Msh3 accelerated intestinal tumorigenesis. The frequency of lymphomas was not affected. Furthermore, mismatch-directed antirecombination and sensitivity to methylating agents required Msh2 and Msh6, but not Msh3. Thus, loss of mismatch repair functions specific to Msh2/Msh6 is sufficient for lymphoma development in mice, whereas predisposition to intestinal cancer requires loss of function of both Msh2/Msh6 and Msh2/Msh3.

[54448] It is appreciated that the abovementioned animal model for MSH3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[54449] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

te Riele, H. : HNPCC-like cancer predisposition in mice through.

[54452] Further studies establishing the function and utilities of MSH3 are found in John Hopkins OMIM database record ID 600887, and in cited publications numbered 716 and 9925–7797 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221) is another VGAM1599 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15485, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54453] Another function of VGAM1599 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799) is an-

other VGAM1599 host target gene. RNMT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNMT BINDING SITE, designated SEQ ID:9881, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54454] Another function of VGAM1599 is therefore inhibition of RNA (guanine-7-) Methyltransferase (RNMT, Accession NM\_003799), a gene which catalyzes the methylation of GpppN- at the guanine N7 position. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNMT. The function of RNMT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326) is another VGAM1599 host target gene. TNFSF4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by TNFSF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF4 BINDING SITE, designated SEQ ID:9328, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54455] Another function of VGAM1599 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 4 (tax-transcriptionally activated glycoprotein 1, 34kDa) (TNFSF4, Accession NM\_003326), a gene which co-stimulates t cell proliferation and cytokine production. Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF4. The function of TNFSF4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM463. Apolipoprotein L, 4 (APOL4, Accession NM\_030643) is another VGAM1599 host target gene. APOL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL4, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:24975, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54456] Another function of VGAM1599 is therefore inhibition of Apolipoprotein L, 4 (APOL4, Accession NM\_030643). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4. Chromosome 21 Open Reading Frame 42 (C21orf42, Accession NM\_058184) is another VGAM1599 host target gene. C21orf42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf42 BINDING SITE, designated SEQ ID:27749, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54457] Another function of VGAM1599 is therefore inhibition of Chromosome 21 Open Reading Frame 42 (C21orf42, Ac-

cession NM\_058184). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf42. CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033331) is another VGAM1599 host target gene. CDC14B BINDING SITE1 and CDC14B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CDC14B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDC14B BINDING SITE1 and CDC14B BINDING SITE2, designated SEQ ID:27163 and SEQ ID:9759 respectively, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54458] Another function of VGAM1599 is therefore inhibition of CDC14 Cell Division Cycle 14 Homolog B (*S. cerevisiae*) (CDC14B, Accession NM\_033331). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDC14B. Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259) is another VGAM1599 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33034, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54459] Another function of VGAM1599 is therefore inhibition of Dedicator of Cyto-kinesis 3 (DOCK3, Accession XM\_039259). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. FLJ11850 (Accession NM\_022741) is another VGAM1599 host target gene. FLJ11850 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11850, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11850 BINDING SITE, designated SEQ ID:22949, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54460] Another function of VGAM1599 is therefore inhibition of FLJ11850 (Accession NM\_022741). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11850. FLJ33069 (Accession NM\_144649) is another VGAM1599 host target gene. FLJ33069 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ33069, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ33069 BINDING SITE, designated SEQ ID:29474, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54461] Another function of VGAM1599 is therefore inhibition of FLJ33069 (Accession NM\_144649). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ33069. GMPPB (Accession XM\_171044) is another VGAM1599 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45810, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54462] Another function of VGAM1599 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. HCA4 (Accession XM\_085287) is another VGAM1599 host target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38021, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54463] Another function of VGAM1599 is therefore inhibition of HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4.

HNK-1ST (Accession NM\_004854) is another VGAM1599 host target gene. HNK-1ST BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HNK-1ST, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNK-1ST BINDING SITE, designated SEQ ID:11265, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54464] Another function of VGAM1599 is therefore inhibition of HNK-1ST (Accession NM\_004854). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNK-1ST. KIAA0618 (Accession NM\_014833) is another VGAM1599 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16833, to the nucleotide sequence of VGAM1599 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4310.

[54465] Another function of VGAM1599 is therefore inhibition of KIAA0618 (Accession NM\_014833). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA0763 (Accession NM\_014869) is another VGAM1599 host target gene. KIAA0763 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0763, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0763 BINDING SITE, designated SEQ ID:16965, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54466] Another function of VGAM1599 is therefore inhibition of KIAA0763 (Accession NM\_014869). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0763. KIAA1884 (Accession XM\_055539) is another VGAM1599 host target gene. KIAA1884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1884, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1884 BINDING SITE, designated SEQ ID:36292, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54467] Another function of VGAM1599 is therefore inhibition of KIAA1884 (Accession XM\_055539). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1884. MGC13017 (Accession NM\_080656) is another VGAM1599 host target gene. MGC13017 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13017 BINDING SITE, designated SEQ ID:27944, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54468] Another function of VGAM1599 is therefore inhibition of MGC13017 (Accession NM\_080656). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with MGC13017. MGC22805 (Accession NM\_144590) is another VGAM1599 host target gene. MGC22805 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC22805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC22805 BINDING SITE, designated SEQ ID:29409, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54469] Another function of VGAM1599 is therefore inhibition of MGC22805 (Accession NM\_144590). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC22805. PSR (Accession XM\_036784) is another VGAM1599 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32494, to the nucleotide sequence of

VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54470] Another function of VGAM1599 is therefore inhibition of PSR (Accession XM\_036784). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809) is another VGAM1599 host target gene. TGIF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TGIF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TGIF2 BINDING SITE, designated SEQ ID:22363, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54471] Another function of VGAM1599 is therefore inhibition of TGFB-induced Factor 2 (TALE family homeobox) (TGIF2, Accession NM\_021809). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TGIF2. Vav 3 Oncogene (VAV3, Accession NM\_006113) is another VGAM1599 host target gene. VAV3 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by VAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAV3 BINDING SITE, designated SEQ ID:12757, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54472] Another function of VGAM1599 is therefore inhibition of Vav 3 Oncogene (VAV3, Accession NM\_006113). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAV3. LOC139770 (Accession XM\_060053) is another VGAM1599 host target gene. LOC139770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139770 BINDING SITE, designated SEQ ID:37144, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54473] Another function of VGAM1599 is therefore inhibition of

LOC139770 (Accession XM\_060053). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139770. LOC148413 (Accession XM\_086176) is another VGAM1599 host target gene. LOC148413 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148413, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148413 BINDING SITE, designated SEQ ID:38532, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54474] Another function of VGAM1599 is therefore inhibition of LOC148413 (Accession XM\_086176). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148413. LOC154881 (Accession XM\_088063) is another VGAM1599 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39495, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54475] Another function of VGAM1599 is therefore inhibition of LOC154881 (Accession XM\_088063). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154881. LOC158376 (Accession XM\_098934) is another VGAM1599 host target gene. LOC158376 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158376 BINDING SITE, designated SEQ ID:41971, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54476] Another function of VGAM1599 is therefore inhibition of LOC158376 (Accession XM\_098934). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158376. LOC168448 (Accession XM\_095105) is an-

other VGAM1599 host target gene. LOC168448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC168448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168448 BINDING SITE, designated SEQ ID:40247, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54477] Another function of VGAM1599 is therefore inhibition of LOC168448 (Accession XM\_095105). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168448. LOC200772 (Accession XM\_117275) is another VGAM1599 host target gene. LOC200772 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200772, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200772 BINDING SITE, designated SEQ ID:43346, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54478] Another function of VGAM1599 is therefore inhibition of LOC200772 (Accession XM\_117275). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200772. LOC220074 (Accession NM\_145309) is another VGAM1599 host target gene. LOC220074 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220074 BINDING SITE, designated SEQ ID:29823, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54479] Another function of VGAM1599 is therefore inhibition of LOC220074 (Accession NM\_145309). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220074. LOC222962 (Accession XM\_167291) is another VGAM1599 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44630, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54480] Another function of VGAM1599 is therefore inhibition of LOC222962 (Accession XM\_167291). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC256401 (Accession XM\_171149) is another VGAM1599 host target gene. LOC256401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256401 BINDING SITE, designated SEQ ID:45945, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54481] Another function of VGAM1599 is therefore inhibition of LOC256401 (Accession XM\_171149). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC256401. LOC90408 (Accession XM\_031517) is another VGAM1599 host target gene. LOC90408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90408 BINDING SITE, designated SEQ ID:31395, to the nucleotide sequence of VGAM1599 RNA, herein designated VGAM RNA, also designated SEQ ID:4310.

[54482] Another function of VGAM1599 is therefore inhibition of LOC90408 (Accession XM\_031517). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90408. LOC91516 (Accession XM\_038924) is another VGAM1599 host target gene. LOC91516 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91516 BINDING SITE, designated SEQ ID:32954, to the nucleotide sequence of VGAM1599 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4310.

[54483] Another function of VGAM1599 is therefore inhibition of LOC91516 (Accession XM\_038924). Accordingly, utilities of VGAM1599 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91516. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1600 (VGAM1600) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54484] VGAM1600 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1600 was detected is described hereinabove with reference to Figs. 1–8.

[54485] VGAM1600 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54486] VGAM1600 gene encodes a VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM1600 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1600 precursor RNA is designated SEQ ID:1586, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1586 is located at position 23495 relative to the genome of Human Adenovirus E.

- [54487] VGAM1600 precursor RNA folds onto itself, forming VGAM1600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54488] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1600 folded precursor RNA into VGAM1600 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1600 RNA is designated SEQ ID:4311, and is provided hereinbelow with reference to the sequence listing part.

[54489] VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1600 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54490] VGAM1600 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1600 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1600 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54491] The complementary binding of VGAM1600 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1600 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1600 host target RNA into VGAM1600 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54492] It is appreciated that VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1600 host target genes. The mRNA of

each one of this plurality of VGAM1600 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1600 RNA, herein designated VGAM RNA, and which when bound by VGAM1600 RNA causes inhibition of translation of respective one or more VGAM1600 host target proteins.

[54493] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1600 gene, herein designated VGAM GENE, on one or more VGAM1600 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[54494] It is yet further appreciated that a function of VGAM1600 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM1600 correlate with, and may be deduced from, the identity of the host target genes which VGAM1600 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54495] Nucleotide sequences of the VGAM1600 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1600 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1600 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1600 are further described hereinbelow with reference to Table 1.

[54496] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1600 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1600 RNA,

herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54497] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1600 gene, herein designated VGAM is inhibition of expression of VGAM1600 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1600 correlate with, and may be deduced from, the identity of the target genes which VGAM1600 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54498] Aquaporin 6, Kidney Specific (AQP6, Accession NM\_053286) is a VGAM1600 host target gene. AQP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by AQP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP6 BINDING SITE, designated SEQ ID:27613, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54499] A function of VGAM1600 is therefore inhibition of Aquaporin 6, Kidney Specific (AQP6, Accession NM\_053286), a gene which participates in distinct physiologic function

such as glomerular filtration, tubular endocytosis, and acid–base metabolism. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP6. The function of AQP6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM340. Cadherin 5, Type 2, VE–cadherin (vascular epithelium) (CDH5, Accession NM\_001795) is another VGAM1600 host target gene. CDH5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH5 BINDING SITE, designated SEQ ID:7547, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54500] Another function of VGAM1600 is therefore inhibition of Cadherin 5, Type 2, VE–cadherin (vascular epithelium) (CDH5, Accession NM\_001795), a gene which associates with alpha–catenin forming a link to the cytoskeleton. Accordingly, utilities of VGAM1600 include diagnosis, pre–

vention and treatment of diseases and clinical conditions associated with CDH5. The function of CDH5 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM1342. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586) is another VGAM1600 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15946, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54501] Another function of VGAM1600 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM\_000595) is another VGAM1600 host target gene. LTA BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:6195, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54502] Another function of VGAM1600 is therefore inhibition of Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM\_000595), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfr2 and tnfrsf14/hvem. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA. The function of LTA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM662.SNL (Accession NM\_003088) is another VGAM1600 host target gene. SNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SNL BINDING SITE, designated SEQ ID:9063, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54503] Another function of VGAM1600 is therefore inhibition of SNL (Accession NM\_003088), a gene which organizes filamentous actin into bundles with a minimum of 4.1:1 actin/fascin ratio. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNL. The function of SNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM675.SORCS3 (Accession NM\_014978) is another VGAM1600 host target gene. SORCS3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SORCS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS3 BINDING SITE, designated SEQ ID:17364, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54504] Another function of VGAM1600 is therefore inhibition of SORCS3 (Accession NM\_014978). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS3. Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM\_003382) is another VGAM1600 host target gene. VIPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VIPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIPR2 BINDING SITE, designated SEQ ID:9412, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54505] Another function of VGAM1600 is therefore inhibition of Vasoactive Intestinal Peptide Receptor 2 (VIPR2, Accession NM\_003382). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIPR2. Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM\_005430) is another VGAM1600 host target gene. WNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT1 BINDING SITE, designated SEQ ID:11895, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54506] Another function of VGAM1600 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM\_005430), a gene which may have a role in development of the central nervous system. Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT1. The function of WNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381.DKFZP434P0111 (Accession XM\_041116) is another VGAM1600 host target gene. DKFZP434P0111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0111

BINDING SITE, designated SEQ ID:33454, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54507] Another function of VGAM1600 is therefore inhibition of DKFZP434P0111 (Accession XM\_041116). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0111. DKFZp586I021 (Accession NM\_032271) is another VGAM1600 host target gene. DKFZp586I021 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp586I021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp586I021 BINDING SITE, designated SEQ ID:26028, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54508] Another function of VGAM1600 is therefore inhibition of DKFZp586I021 (Accession NM\_032271). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp586I021. Pyruvate Dehydrogenase Kinase,

Isoenzyme 2 (PDK2, Accession NM\_002611) is another VGAM1600 host target gene. PDK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK2 BINDING SITE, designated SEQ ID:8475, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54509] Another function of VGAM1600 is therefore inhibition of Pyruvate Dehydrogenase Kinase, Isoenzyme 2 (PDK2, Accession NM\_002611). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK2. REC8 (Accession NM\_005132) is another VGAM1600 host target gene. REC8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by REC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REC8 BINDING SITE, designated SEQ ID:11608, to the nucleotide sequence of VGAM1600 RNA, herein

designated VGAM RNA, also designated SEQ ID:4311.

[54510] Another function of VGAM1600 is therefore inhibition of REC8 (Accession NM\_005132). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REC8. SIMRP7 (Accession XM\_166462) is another VGAM1600 host target gene. SIMRP7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIMRP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIMRP7 BINDING SITE, designated SEQ ID:44371, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54511] Another function of VGAM1600 is therefore inhibition of SIMRP7 (Accession XM\_166462). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIMRP7. Tumor Necrosis Factor (ligand) Superfamily, Member 13 (TNFSF13, Accession NM\_003808) is another VGAM1600 host target gene. TNFSF13 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by TNFSF13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF13 BINDING SITE, designated SEQ ID:9898, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54512] Another function of VGAM1600 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 13 (TNFSF13, Accession NM\_003808). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF13. LOC145989 (Accession XM\_004815) is another VGAM1600 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29951, to the nucleotide sequence of VGAM1600 RNA, herein designated VGAM RNA, also designated SEQ ID:4311.

[54513] Another function of VGAM1600 is therefore inhibition of

LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1600 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1601 (VGAM1601) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54514] VGAM1601 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1601 was detected is described hereinabove with reference to Figs. 1-8.

[54515] VGAM1601 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54516] VGAM1601 gene encodes a VGAM1601 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1601 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1601 precursor RNA is designated SEQ ID:1587, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1587 is located at position 32517 relative to the genome of Human Adenovirus E.

- [54517] VGAM1601 precursor RNA folds onto itself, forming VGAM1601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54518] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1601 folded precursor RNA into VGAM1601 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 65%) nucleotide se-

quence of VGAM1601 RNA is designated SEQ ID:4312, and is provided hereinbelow with reference to the sequence listing part.

[54519] VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1601 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54520] VGAM1601 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1601 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1601 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54521] The complementary binding of VGAM1601 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1601 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1601 host target RNA into VGAM1601 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54522] It is appreciated that VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1601 host target genes. The mRNA of each one of this plurality of VGAM1601 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1601 RNA, herein designated VGAM RNA, and which when bound by VGAM1601 RNA causes inhibition of translation of respective one or more VGAM1601 host target proteins.

[54523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1601 gene, herein designated VGAM GENE, on one or more VGAM1601 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54524] It is yet further appreciated that a function of VGAM1601

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM1601 correlate with, and may be deduced from, the identity of the host target genes which VGAM1601 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54525] Nucleotide sequences of the VGAM1601 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1601 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1601 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1601 are further described hereinbelow with reference to Table 1.

[54526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1601 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1601 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54527] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1601 gene, herein designated VGAM is inhibition of expression of VGAM1601 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1601 correlate with, and may be deduced from, the identity of the target genes which VGAM1601 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54528] Chediak–Higashi Syndrome 1 (CHS1, Accession NM\_000081) is a VGAM1601 host target gene. CHS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHS1 BINDING SITE, designated SEQ ID:5527, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54529] A function of VGAM1601 is therefore inhibition of Chediak–Higashi Syndrome 1 (CHS1, Accession NM\_000081), a gene which may sort endosomal resident proteins into late multivesicular endosome. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with CHS1. The function of CHS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Desmocollin 3 (DSC3, Accession NM\_001941) is another VGAM1601 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2, designated SEQ ID:7650 and SEQ ID:23661 respectively, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54530] Another function of VGAM1601 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM\_001941), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM230. Mitogen-activated Protein Kinase Kinase Kinase 9 (MAP3K9, Accession XM\_027237) is another VGAM1601 host target gene. MAP3K9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K9 BINDING SITE, designated SEQ ID:30459, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54531] Another function of VGAM1601 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 9 (MAP3K9, Accession XM\_027237), a gene which is a MIXED-LINEAGE KINASE 1. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K9. The function of MAP3K9 has been established by previous studies. While protein kinases vary widely in their primary structures, each contains a catalytic domain of 250 to 300 amino acids, which includes 11 highly con-

served motifs or subdomains separated by sequences of amino acids with reduced conservation. The presence of these motifs within a newly characterized sequence is, therefore, strongly predictive of PK activity. Furthermore, specificity of a PK for phosphorylation of either tyr or ser/thr can be predicted by the sequence of 2 of the motifs (VIb and VIII) in which different residues are conserved in each class. PKs with similar substrates or modes of activation cluster into families, whose members share a higher degree of catalytic-domain sequence identity with each other than with other members of the same PK specificity class. Hanks (1991) described 10 families of ser/thr PKs and 11 families of tyr PKs. Using the polymerase chain reaction to study mRNA expressed in human epithelial tumor cells, Dorow et al. (1993) identified a member of a new family of protein kinases. The catalytic domain of these kinases had amino acid sequence similarity to both the tyr-specific and the ser/thr-specific kinase classes. Dorow et al. (1993) isolated clones representing 2 members of this new family from a human colonic epithelial cDNA library. The predicted amino acid sequence revealed that, in addition to their unusual nature of the kinase catalytic domains, they contain 2 leu/ile-zipper motifs and a

basic sequence near their C-termini. Because they possess domains associated with proteins from 2 distinct functional groups, these kinases were referred to as mixed-lineage kinases (MLK) 1 and 2. MLK1 mRNA was found to be expressed in epithelial tumor cell lines of colonic, breast, and esophageal origin. The similarity score with MLK1 varied from 73 down to 61 for the following tyr PKs; ROS (OMIM Ref. No. 165020), ABL (OMIM Ref. No. 189980), EGFR (OMIM Ref. No. 131550), SRC (OMIM Ref. No. 190090), TRK (OMIM Ref. No. 164970), PDGFR (173410, 173490), INSR (OMIM Ref. No. 147670). The similarity score with MLK1 was 63 for RAF (OMIM Ref. No. 164760) and 52 for MOS (OMIM Ref. No. 190060)

[54532] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54533] Dorow, D. S.; Devereux, L.; Dietzsch, E.; De Kretser, T. : Identification of a new family of human epithelial protein kinases containing two leucine/isoleucine-zipper domains. *Europ. J. Biochem.* 213: 701-710, 1993. ; and

[54534] Hanks, S. K. : Eukaryotic protein kinases. *Curr. Opin. Struct. Biol.* 1: 369-383, 1991.

[54535] Further studies establishing the function and utilities of

MAP3K9 are found in John Hopkins OMIM database record ID 600136, and in cited publications numbered 1587–1588 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656) is another VGAM1601 host target gene. NEU3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEU3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEU3 BINDING SITE, designated SEQ ID:13453, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54536] Another function of VGAM1601 is therefore inhibition of Sialidase 3 (membrane sialidase) (NEU3, Accession NM\_006656). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEU3. Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM\_000901) is another VGAM1601 host target gene. NR3C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

NR3C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR3C2 BINDING SITE, designated SEQ ID:6597, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54537] Another function of VGAM1601 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 2 (NR3C2, Accession NM\_000901), a gene which is to increase ion and water transport and thus raise extracellular fluid volume and blood pressure and lower potassium levels. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C2. The function of NR3C2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM186. Protocadherin Alpha 1 (PCDHA1, Accession NM\_031411) is another VGAM1601 host target gene. PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA1, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA1 BINDING SITE1 and PCDHA1 BINDING SITE2, designated SEQ ID:25380 and SEQ ID:20861 respectively, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54538] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 1 (PCDHA1, Accession NM\_031411). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA1. Protocadherin Alpha 10 (PCDHA10, Accession NM\_031860) is another VGAM1601 host target gene. PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA10 BINDING SITE1 and PCDHA10 BINDING SITE2, designated SEQ ID:25612 and SEQ ID:20881 respectively, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54539] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 10 (PCDHA10, Accession NM\_031860). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA10. Protocadherin Alpha 13 (PCDHA13, Accession NM\_018904) is another VGAM1601 host target gene. PCDHA13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA13 BINDING SITE, designated SEQ ID:20902, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54540] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 13 (PCDHA13, Accession NM\_018904). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA13. Protocadherin Alpha 2 (PCDHA2, Accession NM\_018905) is another VGAM1601 host target gene. PCDHA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PCDHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA2 BINDING SITE, designated SEQ ID:20912, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54541] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 2 (PCDHA2, Accession NM\_018905). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA2. Protocadherin Alpha 3 (PCDHA3, Accession NM\_018906) is another VGAM1601 host target gene. PCDHA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA3 BINDING SITE, designated SEQ ID:20922, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54542] Another function of VGAM1601 is therefore inhibition of

Protocadherin Alpha 3 (PCDHA3, Accession NM\_018906). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA3. Protocadherin Alpha 4 (PCDHA4, Accession NM\_018907) is another VGAM1601 host target gene. PCDHA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA4 BINDING SITE, designated SEQ ID:20932, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54543] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 4 (PCDHA4, Accession NM\_018907). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA4. Protocadherin Alpha 5 (PCDHA5, Accession NM\_018908) is another VGAM1601 host target gene. PCDHA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA5, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA5 BINDING SITE, designated SEQ ID:20942, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54544] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 5 (PCDHA5, Accession NM\_018908). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA5. Protocadherin Alpha 6 (PCDHA6, Accession NM\_018909) is another VGAM1601 host target gene. PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA6 BINDING SITE1 and PCDHA6 BINDING SITE2, designated SEQ ID:20952 and SEQ ID:25584 respectively, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54545] Another function of VGAM1601 is therefore inhibition of

Protocadherin Alpha 6 (PCDHA6, Accession NM\_018909). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA6. Protocadherin Alpha 8 (PCDHA8, Accession NM\_018911) is another VGAM1601 host target gene. PCDHA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA8 BINDING SITE, designated SEQ ID:20972, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54546] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 8 (PCDHA8, Accession NM\_018911). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA8. Protocadherin Alpha 9 (PCDHA9, Accession NM\_031857) is another VGAM1601 host target gene. PCDHA9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHA9, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE, designated SEQ ID:25597, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54547] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM\_031857), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM\_018898) is another VGAM1601 host target gene. PCDHAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC1 BINDING SITE, designated

SEQ ID:20841, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54548] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha Subfamily C, 1 (PCDHAC1, Accession NM\_018898). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC1. Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM\_018899) is another VGAM1601 host target gene. PCDHAC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHAC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHAC2 BINDING SITE, designated SEQ ID:20851, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54549] Another function of VGAM1601 is therefore inhibition of Protocadherin Alpha Subfamily C, 2 (PCDHAC2, Accession NM\_018899). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHAC2. HIC (Accession

XM\_041273) is another VGAM1601 host target gene. HIC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC BINDING SITE, designated SEQ ID:33492, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54550] Another function of VGAM1601 is therefore inhibition of HIC (Accession XM\_041273). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC. KIAA0648 (Accession XM\_094043) is another VGAM1601 host target gene. KIAA0648 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0648 BINDING SITE, designated SEQ ID:40219, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54551] Another function of VGAM1601 is therefore inhibition of KIAA0648 (Accession XM\_094043). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0648. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469) is another VGAM1601 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BGRL2 BINDING SITE, designated SEQ ID:25525, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54552] Another function of VGAM1601 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC51133 (Accession NM\_016121) is another VGAM1601 host target gene. LOC51133 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC51133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51133 BINDING SITE, designated SEQ ID:18204, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54553] Another function of VGAM1601 is therefore inhibition of LOC51133 (Accession NM\_016121). Accordingly, utilities of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51133. LOC91286 (Accession XM\_037444) is another VGAM1601 host target gene. LOC91286 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91286 BINDING SITE, designated SEQ ID:32622, to the nucleotide sequence of VGAM1601 RNA, herein designated VGAM RNA, also designated SEQ ID:4312.

[54554] Another function of VGAM1601 is therefore inhibition of LOC91286 (Accession XM\_037444). Accordingly, utilities

of VGAM1601 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1602 (VGAM1602) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54555] VGAM1602 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1602 was detected is described hereinabove with reference to Figs. 1-8.

[54556] VGAM1602 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus E. VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54557] VGAM1602 gene encodes a VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1602 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nu-

cleotide sequence of VGAM1602 precursor RNA is designated SEQ ID:1588, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1588 is located at position 27497 relative to the genome of Human Adenovirus E.

- [54558] VGAM1602 precursor RNA folds onto itself, forming VGAM1602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54559] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1602 folded precursor RNA into VGAM1602 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM1602 RNA is designated SEQ ID:4313, and

is provided hereinbelow with reference to the sequence listing part.

[54560] VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1602 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[54561] VGAM1602 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1602 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM1602 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54562] The complementary binding of VGAM1602 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1602 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1602 host target RNA into VGAM1602 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54563] It is appreciated that VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1602 host target genes. The mRNA of each one of this plurality of VGAM1602 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com–

plementary to VGAM1602 RNA, herein designated VGAM RNA, and which when bound by VGAM1602 RNA causes inhibition of translation of respective one or more VGAM1602 host target proteins.

[54564] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1602 gene, herein designated VGAM GENE, on one or more VGAM1602 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54565] It is yet further appreciated that a function of VGAM1602 is inhibition of expression of host target genes, as part of

a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1602 include diagnosis, prevention and treatment of viral infection by Human Adenovirus E. Specific functions, and accordingly utilities, of VGAM1602 correlate with, and may be deduced from, the identity of the host target genes which VGAM1602 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54566] Nucleotide sequences of the VGAM1602 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1602 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1602 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1602 are further described hereinbelow with reference to Table 1.

[54567] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1602 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1602 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54568] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM1602 gene, herein designated VGAM is inhibition of expression of VGAM1602 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1602 correlate with, and may be deduced from, the identity of the target genes which VGAM1602 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54569] Deoxyguanosine Kinase (DGUOK, Accession NM\_080915) is a VGAM1602 host target gene. DGUOK BINDING SITE1 and DGUOK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGUOK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGUOK BINDING SITE1 and DGUOK BINDING SITE2, designated SEQ ID:28137 and SEQ ID:28140 respectively, to the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, also designated SEQ ID:4313.

[54570] A function of VGAM1602 is therefore inhibition of Deoxyguanosine Kinase (DGUOK, Accession NM\_080915), a gene which is deoxyguanosine kinase and mediates phosphorylation of several deoxyribonucleosides. Accordingly,

utilities of VGAM1602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGUOK. The function of DGUOK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM121.FLJ12505 (Accession NM\_024749) is another VGAM1602 host target gene. FLJ12505 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12505 BINDING SITE, designated SEQ ID:24091, to the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, also designated SEQ ID:4313.

[54571] Another function of VGAM1602 is therefore inhibition of FLJ12505 (Accession NM\_024749). Accordingly, utilities of VGAM1602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12505. LOC147639 (Accession XM\_085822) is another VGAM1602 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 5` untranslated

region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:38343, to the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, also designated SEQ ID:4313.

[54572] Another function of VGAM1602 is therefore inhibition of LOC147639 (Accession XM\_085822). Accordingly, utilities of VGAM1602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC203286 (Accession XM\_117526) is another VGAM1602 host target gene. LOC203286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203286 BINDING SITE, designated SEQ ID:43495, to the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, also designated SEQ ID:4313.

[54573] Another function of VGAM1602 is therefore inhibition of LOC203286 (Accession XM\_117526). Accordingly, utilities

of VGAM1602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203286. LOC221773 (Accession XM\_165802) is another VGAM1602 host target gene. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221773, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43766, to the nucleotide sequence of VGAM1602 RNA, herein designated VGAM RNA, also designated SEQ ID:4313.

[54574] Another function of VGAM1602 is therefore inhibition of LOC221773 (Accession XM\_165802). Accordingly, utilities of VGAM1602 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1603 (VGAM1603) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54575] VGAM1603 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1603 was detected is described hereinabove with reference to Figs. 1–8.

[54576] VGAM1603 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54577] VGAM1603 gene encodes a VGAM1603 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1603 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1603 precursor RNA is designated SEQ ID:1589, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1589 is located at position 4189 relative to the genome of Taura Syndrome Virus.

[54578] VGAM1603 precursor RNA folds onto itself, forming VGAM1603 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54579] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1603 folded precursor RNA into VGAM1603 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1603 RNA is designated SEQ ID:4314, and is provided hereinbelow with reference to the sequence listing part.

[54580] VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1603 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[54581] VGAM1603 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1603 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1603 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54582] The complementary binding of VGAM1603 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1603 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1603 host target RNA into VGAM1603 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54583] It is appreciated that VGAM1603 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1603 host target genes. The mRNA of each one of this plurality of VGAM1603 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1603 RNA, herein designated VGAM RNA, and which when bound by VGAM1603 RNA causes inhibition of translation of respective one or more VGAM1603 host target proteins.

[54584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1603 gene, herein designated VGAM GENE, on one or more VGAM1603 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54585] It is yet further appreciated that a function of VGAM1603 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1603 correlate with, and may be deduced from, the identity of the host target genes which VGAM1603 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54586] Nucleotide sequences of the VGAM1603 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1603 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1603 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1603 are further  
described hereinbelow with reference to Table 1.

[54587] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1603 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1603 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54588] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1603 gene, herein designated VGAM is  
inhibition of expression of VGAM1603 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1603 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1603  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54589] Microtubule-associated Protein 1B (MAP1B, Accession  
NM\_005909) is a VGAM1603 host target gene. MAP1B

BINDING SITE1 and MAP1B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP1B BINDING SITE1 and MAP1B BINDING SITE2, designated SEQ ID:12536 and SEQ ID:25713 respectively, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54590] A function of VGAM1603 is therefore inhibition of Microtubule-associated Protein 1B (MAP1B, Accession NM\_005909), a gene which may have a role in neuronal plasticity and brain development. Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP1B. The function of MAP1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM316. Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264) is another VGAM1603 host target gene. C22orf5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by C22orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf5 BINDING SITE, designated SEQ ID:14582, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54591] Another function of VGAM1603 is therefore inhibition of Chromosome 22 Open Reading Frame 5 (C22orf5, Accession NM\_012264). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf5. Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614) is another VGAM1603 host target gene. CHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHL1 BINDING SITE, designated SEQ ID:13389, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54592] Another function of VGAM1603 is therefore inhibition of Cell Adhesion Molecule with Homology to L1CAM (close homolog of L1) (CHL1, Accession NM\_006614). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHL1. KIAA1910 (Accession XM\_055514) is another VGAM1603 host target gene. KIAA1910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1910 BINDING SITE, designated SEQ ID:36283, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54593] Another function of VGAM1603 is therefore inhibition of KIAA1910 (Accession XM\_055514). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1910. Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM\_167803) is another VGAM1603 host target gene. PCANAP7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by PCANAP7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCANAP7 BINDING SITE, designated SEQ ID:44836, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54594] Another function of VGAM1603 is therefore inhibition of Prostate Cancer Associated Protein 7 (PCANAP7, Accession XM\_167803). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCANAP7. Prefoldin 1 (PFDN1, Accession NM\_002622) is another VGAM1603 host target gene. PFDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PFDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFDN1 BINDING SITE, designated SEQ ID:8485, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54595] Another function of VGAM1603 is therefore inhibition of

Prefoldin 1 (PFDN1, Accession NM\_002622). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFDN1. LOC148709 (Accession XM\_086281) is another VGAM1603 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38577, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54596] Another function of VGAM1603 is therefore inhibition of LOC148709 (Accession XM\_086281). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC257319 (Accession XM\_171049) is another VGAM1603 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45827, to the nucleotide sequence of VGAM1603 RNA, herein designated VGAM RNA, also designated SEQ ID:4314.

[54597] Another function of VGAM1603 is therefore inhibition of LOC257319 (Accession XM\_171049). Accordingly, utilities of VGAM1603 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1604 (VGAM1604) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54598] VGAM1604 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1604 was detected is described hereinabove with reference to Figs. 1–8.

[54599] VGAM1604 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[54600] VGAM1604 gene encodes a VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1604 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1604 precursor RNA is designated SEQ ID:1590, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1590 is located at position 2524 relative to the genome of Taura Syndrome Virus.

[54601] VGAM1604 precursor RNA folds onto itself, forming VGAM1604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54602] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1604 folded precursor RNA into VGAM1604 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1604 RNA is designated SEQ ID:4315, and is provided hereinbelow with reference to the sequence listing part.

[54603] VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1604 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54604] VGAM1604 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1604 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1604 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54605] The complementary binding of VGAM1604 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1604 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1604 host target RNA into VGAM1604 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54606] It is appreciated that VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1604 host target genes. The mRNA of each one of this plurality of VGAM1604 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1604 RNA, herein designated VGAM RNA, and which when bound by VGAM1604 RNA causes inhibition of translation of respective one or more VGAM1604 host target proteins.

[54607] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1604 gene, herein designated VGAM GENE, on one or more VGAM1604 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54608] It is yet further appreciated that a function of VGAM1604 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1604 correlate with, and may be deduced from, the identity of the host target genes which VGAM1604 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54609] Nucleotide sequences of the VGAM1604 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1604 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1604 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1604 are further described hereinbelow with reference to Table 1.

[54610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1604 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1604 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54611] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1604 gene, herein designated VGAM is inhibition of expression of VGAM1604 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1604 correlate with, and may be deduced from, the identity of the target genes which VGAM1604 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54612] High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483) is a VGAM1604 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:9573, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54613] A function of VGAM1604 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM\_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM552. Chromosome 20 Open Reading Frame 110 (C20orf110, Accession XM\_086728) is another VGAM1604 host target gene. C20orf110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf110 BINDING SITE, designated SEQ ID:38838, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54614] Another function of VGAM1604 is therefore inhibition of Chromosome 20 Open Reading Frame 110 (C20orf110,

Accession XM\_086728). Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf110. FLJ14621 (Accession NM\_032811) is another VGAM1604 host target gene. FLJ14621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14621 BINDING SITE, designated SEQ ID:26577, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54615] Another function of VGAM1604 is therefore inhibition of FLJ14621 (Accession NM\_032811). Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14621. Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM\_015084) is another VGAM1604 host target gene. MRPS27 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS27, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MRPS27 BINDING SITE, designated SEQ ID:17472, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54616] Another function of VGAM1604 is therefore inhibition of Mitochondrial Ribosomal Protein S27 (MRPS27, Accession NM\_015084). Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS27. LOC152766 (Accession XM\_098263) is another VGAM1604 host target gene. LOC152766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152766 BINDING SITE, designated SEQ ID:41553, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54617] Another function of VGAM1604 is therefore inhibition of LOC152766 (Accession XM\_098263). Accordingly, utilities of VGAM1604 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC152766. LOC257206 (Accession XM\_173136) is another VGAM1604 host target gene. LOC257206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257206 BINDING SITE, designated SEQ ID:46385, to the nucleotide sequence of VGAM1604 RNA, herein designated VGAM RNA, also designated SEQ ID:4315.

[54618] Another function of VGAM1604 is therefore inhibition of LOC257206 (Accession XM\_173136). Accordingly, utilities of VGAM1604 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1605 (VGAM1605) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54619] VGAM1605 is a novel bioinformatically detected regula-

tory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1605 was detected is described hereinabove with reference to Figs. 1–8.

[54620] VGAM1605 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54621] VGAM1605 gene encodes a VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1605 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1605 precursor RNA is designated SEQ ID:1591, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1591 is located at position 8483 relative to the genome of Taura Syndrome Virus.

[54622] VGAM1605 precursor RNA folds onto itself, forming VGAM1605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by

miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54623] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1605 folded precursor RNA into VGAM1605 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1605 RNA is designated SEQ ID:4316, and is provided hereinbelow with reference to the sequence listing part.

[54624] VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1605 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54625] VGAM1605 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1605 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1605 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54626] The complementary binding of VGAM1605 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM1605 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1605 host target RNA into VGAM1605 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54627] It is appreciated that VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1605 host target genes. The mRNA of each one of this plurality of VGAM1605 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1605 RNA, herein designated VGAM RNA, and which when bound by VGAM1605 RNA causes inhibition of translation of respective one or more VGAM1605 host target proteins.

[54628] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1605 gene, herein designated VGAM GENE, on one or more VGAM1605 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54629] It is yet further appreciated that a function of VGAM1605 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1605 correlate with, and may be deduced from, the identity of the host target genes which VGAM1605 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54630] Nucleotide sequences of the VGAM1605 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM1605 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1605 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1605 are further described hereinbelow with reference to Table 1.

[54631] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1605 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1605 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54632] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1605 gene, herein designated VGAM is inhibition of expression of VGAM1605 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1605 correlate with, and may be deduced from, the identity of the target genes which VGAM1605 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54633] Secretogranin III (SCG3, Accession NM\_013243) is a VGAM1605 host target gene. SCG3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SCG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCG3 BINDING SITE, designated SEQ ID:14903, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54634] A function of VGAM1605 is therefore inhibition of Secretogranin III (SCG3, Accession NM\_013243). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCG3. Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM\_005630) is another VGAM1605 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12159, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54635] Another function of VGAM1605 is therefore inhibition of

Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM\_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM83. Cylindromatosis (turban tumor syndrome) (CYLD, Accession NM\_015247) is another VGAM1605 host target gene. CYLD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLD BINDING SITE, designated SEQ ID:17577, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54636] Another function of VGAM1605 is therefore inhibition of Cylindromatosis (turban tumor syndrome) (CYLD, Accession NM\_015247). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with CYLD. DKFZp434G179 (Accession XM\_087065) is another VGAM1605 host target gene. DKFZp434G179 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434G179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434G179 BINDING SITE, designated SEQ ID:39042, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54637] Another function of VGAM1605 is therefore inhibition of DKFZp434G179 (Accession XM\_087065). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434G179. FLJ21168 (Accession NM\_025073) is another VGAM1605 host target gene. FLJ21168 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21168, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21168 BINDING SITE, designated SEQ ID:24673, to the

nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54638] Another function of VGAM1605 is therefore inhibition of FLJ21168 (Accession NM\_025073). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21168. MGC9753 (Accession NM\_033419) is another VGAM1605 host target gene. MGC9753 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC9753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC9753 BINDING SITE, designated SEQ ID:27244, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54639] Another function of VGAM1605 is therefore inhibition of MGC9753 (Accession NM\_033419). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC9753. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM1605 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39395, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54640] Another function of VGAM1605 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346) is another VGAM1605 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:21597, to the nucleotide sequence of VGAM1605 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4316.

[54641] Another function of VGAM1605 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. Zinc Finger Protein 262 (ZNF262, Accession NM\_005095) is another VGAM1605 host target gene. ZNF262 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF262, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF262 BINDING SITE, designated SEQ ID:11557, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54642] Another function of VGAM1605 is therefore inhibition of Zinc Finger Protein 262 (ZNF262, Accession NM\_005095). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF262. LOC115129 (Accession XM\_055292) is another VGAM1605 host target gene.

LOC115129 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115129, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115129 BINDING SITE, designated SEQ ID:36253, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54643] Another function of VGAM1605 is therefore inhibition of LOC115129 (Accession XM\_055292). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115129. LOC149478 (Accession XM\_086536) is another VGAM1605 host target gene. LOC149478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149478 BINDING SITE, designated SEQ ID:38756, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54644] Another function of VGAM1605 is therefore inhibition of LOC149478 (Accession XM\_086536). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149478. LOC158318 (Accession XM\_098925) is another VGAM1605 host target gene. LOC158318 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158318 BINDING SITE, designated SEQ ID:41958, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54645] Another function of VGAM1605 is therefore inhibition of LOC158318 (Accession XM\_098925). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158318. LOC90784 (Accession XM\_034109) is another VGAM1605 host target gene. LOC90784 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90784, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90784 BINDING SITE, designated SEQ ID:32003, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54646] Another function of VGAM1605 is therefore inhibition of LOC90784 (Accession XM\_034109). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90784. LOC92492 (Accession XM\_045396) is another VGAM1605 host target gene. LOC92492 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92492, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92492 BINDING SITE, designated SEQ ID:34455, to the nucleotide sequence of VGAM1605 RNA, herein designated VGAM RNA, also designated SEQ ID:4316.

[54647] Another function of VGAM1605 is therefore inhibition of LOC92492 (Accession XM\_045396). Accordingly, utilities of VGAM1605 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC92492. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1606 (VGAM1606) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54648] VGAM1606 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1606 was detected is described hereinabove with reference to Figs. 1–8.

[54649] VGAM1606 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54650] VGAM1606 gene encodes a VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1606 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1606 precursor RNA is designated SEQ ID:1592, and is provided hereinbelow with ref–

erence to the sequence listing part. Nucleotide sequence SEQ ID:1592 is located at position 7811 relative to the genome of Taura Syndrome Virus.

- [54651] VGAM1606 precursor RNA folds onto itself, forming VGAM1606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54652] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1606 folded precursor RNA into VGAM1606 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1606 RNA is designated SEQ ID:4317, and is provided hereinbelow with reference to the sequence listing part.

[54653] VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1606 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[54654] VGAM1606 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1606 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1606 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54655] The complementary binding of VGAM1606 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1606 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1606 host target RNA into VGAM1606 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54656] It is appreciated that VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1606 host target genes. The mRNA of each one of this plurality of VGAM1606 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1606 RNA, herein designated VGAM RNA, and which when bound by VGAM1606 RNA causes

inhibition of translation of respective one or more VGAM1606 host target proteins.

[54657] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1606 gene, herein designated VGAM GENE, on one or more VGAM1606 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54658] It is yet further appreciated that a function of VGAM1606 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1606 include diagnosis, prevention and

treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1606 correlate with, and may be deduced from, the identity of the host target genes which VGAM1606 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54659] Nucleotide sequences of the VGAM1606 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1606 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1606 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1606 are further described hereinbelow with reference to Table 1.

[54660] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1606 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1606 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54661] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1606 gene, herein designated VGAM is inhibition of expression of VGAM1606 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM1606 correlate with, and may be deduced from, the identity of the target genes which VGAM1606 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54662] ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254) is a VGAM1606 host target gene. ATP11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP11B BINDING SITE, designated SEQ ID:39149, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54663] A function of VGAM1606 is therefore inhibition of ATPase, Class VI, Type 11B (ATP11B, Accession XM\_087254), a gene which is phosphorylated in their intermediate state, drives uphill transport of ions across membranes. Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP11B. The function of ATP11B and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM665. Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_080392) is another VGAM1606 host target gene. PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTP4A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A2 BINDING SITE1 and PTP4A2 BINDING SITE2, designated SEQ ID:27831 and SEQ ID:9554 respectively, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54664] Another function of VGAM1606 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 2 (PTP4A2, Accession NM\_080392), a gene which is a protein tyrosine phosphatase which has a C-terminal prenylation site. Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A2. The function of PTP4A2 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM217.DNAM-1 (Accession NM\_006566) is another VGAM1606 host target gene. DNAM-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:13340, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54665] Another function of VGAM1606 is therefore inhibition of DNAM-1 (Accession NM\_006566). Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1. KIAA0426 (Accession NM\_014724) is another VGAM1606 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16313, to the

nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54666] Another function of VGAM1606 is therefore inhibition of KIAA0426 (Accession NM\_014724). Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA1025 (Accession XM\_034056) is another VGAM1606 host target gene. KIAA1025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1025 BINDING SITE, designated SEQ ID:31996, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54667] Another function of VGAM1606 is therefore inhibition of KIAA1025 (Accession XM\_034056). Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1025. KIAA1078 (Accession XM\_036589) is another VGAM1606 host target gene. KIAA1078 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1078, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1078 BINDING SITE, designated SEQ ID:32471, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54668] Another function of VGAM1606 is therefore inhibition of KIAA1078 (Accession XM\_036589). Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1078. LOC147353 (Accession XM\_097227) is another VGAM1606 host target gene. LOC147353 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147353, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147353 BINDING SITE, designated SEQ ID:40836, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54669] Another function of VGAM1606 is therefore inhibition of LOC147353 (Accession XM\_097227). Accordingly, utilities

of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147353. LOC91179 (Accession XM\_036731) is another VGAM1606 host target gene. LOC91179 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91179 BINDING SITE, designated SEQ ID:32493, to the nucleotide sequence of VGAM1606 RNA, herein designated VGAM RNA, also designated SEQ ID:4317.

[54670] Another function of VGAM1606 is therefore inhibition of LOC91179 (Accession XM\_036731). Accordingly, utilities of VGAM1606 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91179. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1607 (VGAM1607) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54671] VGAM1607 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1607 was detected is described hereinabove with reference to Figs. 1–8.

[54672] VGAM1607 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54673] VGAM1607 gene encodes a VGAM1607 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1607 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1607 precursor RNA is designated SEQ ID:1593, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1593 is located at position 567 relative to the genome of Taura Syndrome Virus.

[54674] VGAM1607 precursor RNA folds onto itself, forming VGAM1607 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54675] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1607 folded precursor RNA into VGAM1607 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM1607 RNA is designated SEQ ID:4318, and is provided hereinbelow with reference to the sequence listing part.

[54676] VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1607 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[54677] VGAM1607 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1607 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1607 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54678] The complementary binding of VGAM1607 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1607 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1607 host target RNA into VGAM1607 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54679] It is appreciated that VGAM1607 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1607 host target genes. The mRNA of each one of this plurality of VGAM1607 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1607 RNA, herein designated VGAM RNA, and which when bound by VGAM1607 RNA causes inhibition of translation of respective one or more VGAM1607 host target proteins.

[54680] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1607 gene, herein designated VGAM GENE, on one or more VGAM1607 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54681] It is yet further appreciated that a function of VGAM1607 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1607 correlate with, and may be deduced from, the identity of the host target genes which VGAM1607 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54682] Nucleotide sequences of the VGAM1607 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1607 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1607 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1607 are further  
described hereinbelow with reference to Table 1.

[54683] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1607 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1607 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54684] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1607 gene, herein designated VGAM is  
inhibition of expression of VGAM1607 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1607 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1607  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54685] DKFZp761G0313 (Accession XM\_038026) is a VGAM1607  
host target gene. DKFZp761G0313 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G0313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761G0313 BINDING SITE, designated SEQ ID:32740, to the nucleotide sequence of VGAM1607 RNA, herein designated VGAM RNA, also designated SEQ ID:4318.

[54686] A function of VGAM1607 is therefore inhibition of DKFZp761G0313 (Accession XM\_038026). Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0313. HML2 (Accession NM\_006344) is another VGAM1607 host target gene. HML2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HML2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HML2 BINDING SITE, designated SEQ ID:13040, to the nucleotide sequence of VGAM1607 RNA, herein designated VGAM RNA, also designated SEQ ID:4318.

[54687] Another function of VGAM1607 is therefore inhibition of

HML2 (Accession NM\_006344). Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HML2. LOC139248 (Accession XM\_066582) is another VGAM1607 host target gene. LOC139248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139248 BINDING SITE, designated SEQ ID:37336, to the nucleotide sequence of VGAM1607 RNA, herein designated VGAM RNA, also designated SEQ ID:4318.

[54688] Another function of VGAM1607 is therefore inhibition of LOC139248 (Accession XM\_066582). Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139248. LOC196746 (Accession XM\_113595) is another VGAM1607 host target gene. LOC196746 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196746, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC196746 BINDING SITE, designated SEQ ID:42290, to the nucleotide sequence of VGAM1607 RNA, herein designated VGAM RNA, also designated SEQ ID:4318.

[54689] Another function of VGAM1607 is therefore inhibition of LOC196746 (Accession XM\_113595). Accordingly, utilities of VGAM1607 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196746. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1608 (VGAM1608) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54690] VGAM1608 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1608 was detected is described hereinabove with reference to Figs. 1–8.

[54691] VGAM1608 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Taura Syndrome Virus. VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[54692] VGAM1608 gene encodes a VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1608 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1608 precursor RNA is designated SEQ ID:1594, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1594 is located at position 3052 relative to the genome of Taura Syndrome Virus.

[54693] VGAM1608 precursor RNA folds onto itself, forming VGAM1608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54694] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1608 folded precursor RNA into VGAM1608 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM1608 RNA is designated SEQ ID:4319, and is provided hereinbelow with reference to the sequence listing part.

[54695] VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1608 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54696] VGAM1608 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1608 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1608 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54697] The complementary binding of VGAM1608 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1608 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1608 host target RNA into VGAM1608 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54698] It is appreciated that VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1608 host target genes. The mRNA of each one of this plurality of VGAM1608 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1608 RNA, herein designated VGAM RNA, and which when bound by VGAM1608 RNA causes inhibition of translation of respective one or more VGAM1608 host target proteins.

[54699] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1608 gene, herein designated VGAM GENE, on one or more VGAM1608 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54700] It is yet further appreciated that a function of VGAM1608 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of viral infection by Taura Syndrome Virus. Specific functions, and accordingly utilities, of VGAM1608 correlate with, and may be deduced from, the identity of the host target genes which VGAM1608 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54701] Nucleotide sequences of the VGAM1608 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1608 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1608 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1608 are further described hereinbelow with reference to Table 1.

[54702] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1608 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1608 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54703] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1608 gene, herein designated VGAM is inhibition of expression of VGAM1608 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1608 correlate with, and may be deduced from, the identity of the target genes which VGAM1608 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54704] LFG (Accession XM\_084780) is a VGAM1608 host target gene. LFG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LFG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LFG BINDING SITE, designated SEQ ID:37689, to the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, also designated SEQ ID:4319.

[54705] A function of VGAM1608 is therefore inhibition of LFG

(Accession XM\_084780). Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LFG. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM\_051832) is another VGAM1608 host target gene. MLLT4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MLLT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT4 BINDING SITE, designated SEQ ID:35888, to the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, also designated SEQ ID:4319.

[54706] Another function of VGAM1608 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 4 (MLLT4, Accession XM\_051832), a gene which may act as an intracellular signaling component. Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT4. The function of MLLT4 has been established by previous studies.

Most acute leukemias in infancy and at least 5% of acute lymphoblastic leukemias and acute myeloid leukemias of older children and adults show abnormalities of chromosome band 11q23. In these cases, translocation results in fusion of a gene at 11q23, variously called ALL1, MLL, and the human homolog of *Drosophila* 'trithorax' (OMIM Ref. No. 159555), with part of a gene on chromosome 4 (OMIM Ref. No. 159557), chromosome 9 (OMIM Ref. No. 159558), or chromosome 19 (OMIM Ref. No. 159556). Prasad et al. (1993) described the cloning and characterization of the 'partner gene' involved in a fourth common translocation involving 11q23, t(6;11)(q27;q23). The gene, designated AF6 by them, was found to be expressed in a variety of cell types and to encode a protein of 1,612 amino acids. The protein contains short stretches rich in proline, charged amino acids, serines, or glutamines. In addition, the AF6 protein contains the GLGF motif shared with several proteins of vertebrates and invertebrates thought to be involved in signal transduction at special cell-cell junctions. Using rapid amplification of cDNA ends (RACE) by PCR, Saha et al. (1995) confirmed the breakpoint in AF6 and identified a cDNA clone that was used as a probe to screen a chromosome 6 cosmid library. By flu-

orescence in situ hybridization, the single clone that was isolated was found to map distal to the critically deleted region associated with ovarian malignancies (OMIM Ref. No. 167000). AF6 is therefore distinct from and lies telomeric to that region. This gene is also symbolized MLLT4.

[54707] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54708] Prasad, R.; Gu, Y.; Alder, H.; Nakamura, T.; Canaani, O.; Saito, H.; Huebner, K.; Gale, R. P.; Nowell, P. C.; Kuriyama, K.; Miyazaki, Y.; Croce, C. M.; Canaani, E. : Cloning of the ALL-1 fusion partner, the AF-6 gene, involved in acute myeloid leukemias with the t(6;11) chromosome translocation. Cancer Res. 53: 5624-5628, 1993. ; and

[54709] Saha, V.; Lillington, D. M.; Shelling, A. N.; Chaplin, T.; Yaspo, M.-L.; Ganesan, T. S.; Young, B. D. : AF6 gene on chromosome band 6q27 maps distal to the minimal region of deletion in.

[54710] Further studies establishing the function and utilities of MLLT4 are found in John Hopkins OMIM database record ID 159559, and in cited publications numbered 1846-1847 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695) is another VGAM1608 host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35484, to the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, also designated SEQ ID:4319.

[54711] Another function of VGAM1608 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM\_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM111.NY-REN-25 (Accession XM\_027116) is another VGAM1608 host target gene. NY-REN-25 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by NY-REN-25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NY-REN-25 BINDING SITE, designated SEQ ID:30420, to the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, also designated SEQ ID:4319.

[54712] Another function of VGAM1608 is therefore inhibition of NY-REN-25 (Accession XM\_027116). Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NY-REN-25. LOC219333 (Accession XM\_167944) is another VGAM1608 host target gene. LOC219333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219333 BINDING SITE, designated SEQ ID:44933, to the nucleotide sequence of VGAM1608 RNA, herein designated VGAM RNA, also designated SEQ ID:4319.

[54713] Another function of VGAM1608 is therefore inhibition of

LOC219333 (Accession XM\_167944). Accordingly, utilities of VGAM1608 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1609 (VGAM1609) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54714] VGAM1609 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1609 was detected is described hereinabove with reference to Figs. 1-8.

[54715] VGAM1609 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54716] VGAM1609 gene encodes a VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1609 precursor RNA does not encode a protein. A

nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1609 precursor RNA is designated SEQ ID:1595, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1595 is located at position 8708 relative to the genome of Chimpanzee Cytomegalovirus.

- [54717] VGAM1609 precursor RNA folds onto itself, forming VGAM1609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54718] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1609 folded precursor RNA into VGAM1609 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide se-

quence of VGAM1609 RNA is designated SEQ ID:4320, and is provided hereinbelow with reference to the sequence listing part.

[54719] VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1609 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54720] VGAM1609 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1609 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM1609 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[54721] The complementary binding of VGAM1609 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1609 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1609 host target RNA into VGAM1609 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54722] It is appreciated that VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1609 host target genes. The mRNA of each one of this plurality of VGAM1609 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM1609 RNA, herein designated VGAM RNA, and which when bound by VGAM1609 RNA causes inhibition of translation of respective one or more VGAM1609 host target proteins.

[54723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1609 gene, herein designated VGAM GENE, on one or more VGAM1609 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54724] It is yet further appreciated that a function of VGAM1609

is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1609 correlate with, and may be deduced from, the identity of the host target genes which VGAM1609 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54725] Nucleotide sequences of the VGAM1609 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1609 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1609 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1609 are further described hereinbelow with reference to Table 1.

[54726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1609 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1609 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54727] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1609 gene, herein designated VGAM is inhibition of expression of VGAM1609 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1609 correlate with, and may be deduced from, the identity of the target genes which VGAM1609 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54728] C-myc Binding Protein (MYCBP, Accession NM\_012333) is a VGAM1609 host target gene. MYCBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYCBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCBP BINDING SITE, designated SEQ ID:14722, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54729] A function of VGAM1609 is therefore inhibition of C-myc Binding Protein (MYCBP, Accession NM\_012333), a gene which binds c-Myc stimulating the activation of E-box-dependent transcription. Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MYCBP. The function of MYCBP and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM435. Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM\_138934) is another VGAM1609 host target gene. PPT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE, designated SEQ ID:29060, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54730] Another function of VGAM1609 is therefore inhibition of Palmitoyl-protein Thioesterase 2 (PPT2, Accession NM\_138934), a gene which is a palmitoyl-protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2. The function of PPT2 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM120. Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM\_002836) is another VGAM1609 host target gene. PTPRA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTPRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRA BINDING SITE, designated SEQ ID:8713, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54731] Another function of VGAM1609 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, A (PTPRA, Accession NM\_002836), a gene which is the human homolog of the murine PTPase. Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRA. The function of PTPRA and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1205.FLJ12681 (Accession NM\_022773) is another VGAM1609 host target gene. FLJ12681 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12681 BINDING SITE, designated SEQ ID:23034, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54732] Another function of VGAM1609 is therefore inhibition of FLJ12681 (Accession NM\_022773). Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12681. KIAA0284 (Accession XM\_032235) is another VGAM1609 host target gene. KIAA0284 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0284, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0284 BINDING SITE, designated SEQ ID:31615, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54733] Another function of VGAM1609 is therefore inhibition of

KIAA0284 (Accession XM\_032235). Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0284. LOC222161 (Accession XM\_166596) is another VGAM1609 host target gene. LOC222161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222161 BINDING SITE, designated SEQ ID:44581, to the nucleotide sequence of VGAM1609 RNA, herein designated VGAM RNA, also designated SEQ ID:4320.

[54734] Another function of VGAM1609 is therefore inhibition of LOC222161 (Accession XM\_166596). Accordingly, utilities of VGAM1609 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1610 (VGAM1610) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[54735] VGAM1610 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1610 was detected is described hereinabove with reference to Figs. 1–8.

[54736] VGAM1610 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54737] VGAM1610 gene encodes a VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1610 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1610 precursor RNA is designated SEQ ID:1596, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1596 is located at position 5615 relative to the genome of Chimpanzee Cytomegalovirus.

[54738] VGAM1610 precursor RNA folds onto itself, forming VGAM1610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54739] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1610 folded precursor RNA into VGAM1610 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1610 RNA is designated SEQ ID:4321, and is provided hereinbelow with reference to the sequence listing part.

[54740] VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1610 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[54741] VGAM1610 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1610 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1610 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[54742] The complementary binding of VGAM1610 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1610 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1610 host target RNA into VGAM1610 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54743] It is appreciated that VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1610 host target genes. The mRNA of each one of this plurality of VGAM1610 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1610 RNA, herein designated VGAM RNA, and which when bound by VGAM1610 RNA causes inhibition of translation of respective one or more VGAM1610 host target proteins.

[54744] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1610 gene, herein designated VGAM GENE, on one

or more VGAM1610 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54745] It is yet further appreciated that a function of VGAM1610 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1610 correlate with, and may be deduced from, the identity of the host target genes which VGAM1610 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54746] Nucleotide sequences of the VGAM1610 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1610 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1610 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1610 are further described hereinbelow with reference to Table 1.

[54747] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1610 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1610 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54748] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1610 gene, herein designated VGAM is inhibition of expression of VGAM1610 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1610 correlate with, and may be deduced from, the identity of the target genes which VGAM1610 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54749] Cytochrome P450, Subfamily I (aromatic compound-in-

ducible), Polypeptide 2 (CYP1A2, Accession XM\_044660) is a VGAM1610 host target gene. CYP1A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP1A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE, designated SEQ ID:34254, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54750] A function of VGAM1610 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession XM\_044660), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A2. The function of CYP1A2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74. Poliovirus Receptor (PVR, Accession NM\_006505) is another VGAM1610 host target gene. PVR BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PVR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PVR BINDING SITE, designated SEQ ID:13252, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54751] Another function of VGAM1610 is therefore inhibition of Poliovirus Receptor (PVR, Accession NM\_006505), a gene which is a poliovirus receptor. Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PVR. The function of PVR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1411. Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM\_001243) is another VGAM1610 host target gene. TNFRSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFRSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF8

BINDING SITE, designated SEQ ID:6909, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54752] Another function of VGAM1610 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 8 (TNFRSF8, Accession NM\_001243), a gene which regulates gene expression through activation of nf-kappab. Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF8. The function of TNFRSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154. Hyaluronan Binding Protein 4 (HABP4, Accession XM\_047263) is another VGAM1610 host target gene. HABP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HABP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HABP4 BINDING SITE, designated SEQ ID:34924, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54753] Another function of VGAM1610 is therefore inhibition of Hyaluronan Binding Protein 4 (HABP4, Accession XM\_047263). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HABP4. KIAA1280 (Accession XM\_045766) is another VGAM1610 host target gene. KIAA1280 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1280 BINDING SITE, designated SEQ ID:34549, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54754] Another function of VGAM1610 is therefore inhibition of KIAA1280 (Accession XM\_045766). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1280. Kelch-like 6 (Drosophila) (KLHL6, Accession NM\_130446) is another VGAM1610 host target gene. KLHL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL6 BINDING SITE, designated SEQ ID:28208, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54755] Another function of VGAM1610 is therefore inhibition of Kelch-like 6 (*Drosophila*) (KLHL6, Accession NM\_130446). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL6. OS4 (Accession NM\_005730) is another VGAM1610 host target gene. OS4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS4 BINDING SITE, designated SEQ ID:12286, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54756] Another function of VGAM1610 is therefore inhibition of OS4 (Accession NM\_005730). Accordingly, utilities of

VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS4. PME-1 (Accession NM\_016147) is another VGAM1610 host target gene. PME-1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PME-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PME-1 BINDING SITE, designated SEQ ID:18230, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54757] Another function of VGAM1610 is therefore inhibition of PME-1 (Accession NM\_016147). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PME-1. SARM (Accession NM\_015077) is another VGAM1610 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ

ID:17451, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54758] Another function of VGAM1610 is therefore inhibition of SARM (Accession NM\_015077). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. LOC124930 (Accession XM\_058867) is another VGAM1610 host target gene. LOC124930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124930 BINDING SITE, designated SEQ ID:36765, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54759] Another function of VGAM1610 is therefore inhibition of LOC124930 (Accession XM\_058867). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124930. LOC149276 (Accession XM\_097621) is another VGAM1610 host target gene. LOC149276 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149276 BINDING SITE, designated SEQ ID:40974, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54760] Another function of VGAM1610 is therefore inhibition of LOC149276 (Accession XM\_097621). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149276. LOC157848 (Accession XM\_088405) is another VGAM1610 host target gene. LOC157848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157848 BINDING SITE, designated SEQ ID:39671, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54761] Another function of VGAM1610 is therefore inhibition of

LOC157848 (Accession XM\_088405). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157848. LOC158292 (Accession XM\_098914) is another VGAM1610 host target gene. LOC158292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE, designated SEQ ID:41930, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54762] Another function of VGAM1610 is therefore inhibition of LOC158292 (Accession XM\_098914). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. LOC253893 (Accession XM\_171188) is another VGAM1610 host target gene. LOC253893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253893 BINDING SITE, designated SEQ ID:45970, to the nucleotide sequence of VGAM1610 RNA, herein designated VGAM RNA, also designated SEQ ID:4321.

[54763] Another function of VGAM1610 is therefore inhibition of LOC253893 (Accession XM\_171188). Accordingly, utilities of VGAM1610 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253893. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1611 (VGAM1611) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54764] VGAM1611 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1611 was detected is described hereinabove with reference to Figs. 1–8.

[54765] VGAM1611 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene con-

tained in the human genome.

[54766] VGAM1611 gene encodes a VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1611 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1611 precursor RNA is designated SEQ ID:1597, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1597 is located at position 10114 relative to the genome of Chimpanzee Cytomegalovirus.

[54767] VGAM1611 precursor RNA folds onto itself, forming VGAM1611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54768] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1611 folded precursor RNA into VGAM1611 RNA, herein designated VGAM RNA, a single stranded ~22

nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1611 RNA is designated SEQ ID:4322, and is provided hereinbelow with reference to the sequence listing part.

[54769] VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1611 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54770] VGAM1611 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1611 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1611 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54771] The complementary binding of VGAM1611 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1611 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1611 host target RNA into VGAM1611 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54772] It is appreciated that VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1611 host target genes. The mRNA of each one of this plurality of VGAM1611 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1611 RNA, herein designated VGAM RNA, and which when bound by VGAM1611 RNA causes inhibition of translation of respective one or more VGAM1611 host target proteins.

[54773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1611 gene, herein designated VGAM GENE, on one or more VGAM1611 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54774] It is yet further appreciated that a function of VGAM1611 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1611 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cy-tomegalovirus. Specific functions, and accordingly utilities, of VGAM1611 correlate with, and may be deduced from, the identity of the host target genes which VGAM1611 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54775] Nucleotide sequences of the VGAM1611 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1611 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1611 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1611 are further described hereinbelow with reference to Table 1.

[54776] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM1611 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1611 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54777] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1611 gene, herein designated VGAM is inhibition of expression of VGAM1611 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1611 correlate with, and may be deduced from, the identity of the target genes which VGAM1611 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54778] Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310) is a VGAM1611 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:8102, to the nucleotide sequence of VGAM1611 RNA, herein designated VGAM RNA, also designated SEQ ID:4322.

[54779] A function of VGAM1611 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM\_002310). Accordingly, utilities of VGAM1611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962) is another VGAM1611 host target gene. BTBD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17338, to the nucleotide sequence of VGAM1611 RNA, herein designated VGAM RNA, also designated SEQ ID:4322.

[54780] Another function of VGAM1611 is therefore inhibition of BTB (POZ) Domain Containing 3 (BTBD3, Accession NM\_014962). Accordingly, utilities of VGAM1611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. LOC149351 (Accession XM\_086503) is another VGAM1611 host target gene. LOC149351 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by LOC149351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149351 BINDING SITE, designated SEQ ID:38716, to the nucleotide sequence of VGAM1611 RNA, herein designated VGAM RNA, also designated SEQ ID:4322.

[54781] Another function of VGAM1611 is therefore inhibition of LOC149351 (Accession XM\_086503). Accordingly, utilities of VGAM1611 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149351. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1612 (VGAM1612) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54782] VGAM1612 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1612 was detected is described hereinabove with reference to Figs. 1-8.

[54783] VGAM1612 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54784] VGAM1612 gene encodes a VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1612 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1612 precursor RNA is designated SEQ ID:1598, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1598 is located at position 1800 relative to the genome of Chimpanzee Cytomegalovirus.

[54785] VGAM1612 precursor RNA folds onto itself, forming VGAM1612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1612 folded precursor RNA into VGAM1612 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1612 RNA is designated SEQ ID:4323, and is provided hereinbelow with reference to the sequence listing part.

[54787] VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1612 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54788] VGAM1612 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1612 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1612 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54789] The complementary binding of VGAM1612 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1612 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1612

host target RNA into VGAM1612 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54790] It is appreciated that VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1612 host target genes. The mRNA of each one of this plurality of VGAM1612 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1612 RNA, herein designated VGAM RNA, and which when bound by VGAM1612 RNA causes inhibition of translation of respective one or more VGAM1612 host target proteins.

[54791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1612 gene, herein designated VGAM GENE, on one or more VGAM1612 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54792] It is yet further appreciated that a function of VGAM1612 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1612 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1612 correlate with, and may be deduced from, the identity of the host target genes which VGAM1612 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54793] Nucleotide sequences of the VGAM1612 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1612 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1612 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1612 are further

described hereinbelow with reference to Table 1.

[54794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1612 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1612 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54795] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1612 gene, herein designated VGAM is inhibition of expression of VGAM1612 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1612 correlate with, and may be deduced from, the identity of the target genes which VGAM1612 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54796] KIAA1679 (Accession XM\_046570) is a VGAM1612 host target gene. KIAA1679 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1679, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1679 BINDING SITE,

designated SEQ ID:34750, to the nucleotide sequence of VGAM1612 RNA, herein designated VGAM RNA, also designated SEQ ID:4323.

[54797] A function of VGAM1612 is therefore inhibition of KIAA1679 (Accession XM\_046570). Accordingly, utilities of VGAM1612 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1679. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1613 (VGAM1613) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54798] VGAM1613 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1613 was detected is described hereinabove with reference to Figs. 1-8.

[54799] VGAM1613 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54800] VGAM1613 gene encodes a VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1613 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1613 precursor RNA is designated SEQ ID:1599, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1599 is located at position 4267 relative to the genome of Chimpanzee Cytomegalovirus.

[54801] VGAM1613 precursor RNA folds onto itself, forming VGAM1613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54802] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1613 folded precursor RNA into VGAM1613 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM1613 RNA is designated SEQ ID:4324, and is provided hereinbelow with reference to the sequence listing part.

[54803] VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1613 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54804] VGAM1613 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1613 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1613 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54805] The complementary binding of VGAM1613 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1613 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1613 host target RNA into VGAM1613 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54806] It is appreciated that VGAM1613 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1613 host target genes. The mRNA of each one of this plurality of VGAM1613 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1613 RNA, herein designated VGAM RNA, and which when bound by VGAM1613 RNA causes inhibition of translation of respective one or more VGAM1613 host target proteins.

[54807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1613 gene, herein designated VGAM GENE, on one or more VGAM1613 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[54808] It is yet further appreciated that a function of VGAM1613 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1613 correlate with, and may be deduced from, the identity of the host target genes which VGAM1613 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54809] Nucleotide sequences of the VGAM1613 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1613 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1613 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1613 are further described hereinbelow with reference to Table 1.

[54810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1613 host target RNA, and

schematic representation of the complementarity of each of these host target binding sites to VGAM1613 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54811] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1613 gene, herein designated VGAM is inhibition of expression of VGAM1613 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1613 correlate with, and may be deduced from, the identity of the target genes which VGAM1613 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54812] Cytokine Receptor-like Factor 1 (CRLF1, Accession NM\_004750) is a VGAM1613 host target gene. CRLF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRLF1 BINDING SITE, designated SEQ ID:11139, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54813] A function of VGAM1613 is therefore inhibition of Cy-

tokine Receptor-like Factor 1 (CRLF1, Accession NM\_004750), a gene which is similar to cytokine type 1 receptors. Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRLF1. The function of CRLF1 has been established by previous studies. Elson et al. (1998) described the identification, cloning, and expression pattern of human cytokine-like factor-1, which they designated CLF1, as well as the identification and cloning of the mouse homolog. They were identified from expressed sequence tags using amino acid sequences from conserved regions of the cytokine type I receptor family. The human and mouse CRLF1 proteins share 96% amino acid identity and significant homology with many cytokine type I receptors. The human cDNA encodes a precursor protein of 422 amino acids with a putative signal peptide of 37 amino acids. CRLF1 is a secreted protein, suggesting that it is either a soluble subunit within a cytokine receptor complex, like the soluble form of IL6R (OMIM Ref. No. 147880) or a subunit of a multimeric cytokine, e.g., IL12B (OMIM Ref. No. 161561). The highest levels of CRLF1 mRNA were observed in lymph node, spleen, thymus, appendix, placenta, stomach, and fetal lung, with

constitutive expression of CRLF1 mRNA detected in a human kidney fibroblast cell line. In fibroblast primary cell cultures, CRLF1 mRNA was upregulated by TNF- $\alpha$  (OMIM Ref. No. 191160), interleukin-6 (OMIM Ref. No. 147620), and gamma-interferon (OMIM Ref. No. 147570). Western blot analysis of recombinant forms of CRLF1 showed that the protein has the tendency to form covalently linked dimers and tetramers. These results suggested that CRLF1 is a novel soluble cytokine receptor subunit or part of a novel cytokine complex, possibly playing a regulatory role in the immune system and during fetal development Alexander et al. (1999) found that, although in situ hybridization showed Nr6 expression at multiple sites in the developing embryo, mice lacking Nr6 did not display obvious abnormalities and were born in the expected numbers. Neonatal Nr6  $-/-$  mice failed to suckle, however, and died within 24 hours of birth, suggesting that Nr6 is necessary for the recognition of processing pheromonal signals or for the mechanics of suckling itself. In addition, Nr6  $-/-$  mice had reduced numbers of hemopoietic progenitor cells, suggesting a potential role in the regulation of primitive hemopoiesis

[54814] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [54815] Elson, G. C. A.; Graber, P.; Losberger, C.; Herren, S.; Gretener, D.; Menoud, L. N.; Wells, T. N. C.; Kosco-Vilbois, M. H.; Gauchat, J.-F. : Cytokine-like factor-1, a novel soluble protein, shares homology with members of the cytokine type I receptor family. *J. Immun.* 161: 1371-1379, 1998. ; and
- [54816] Alexander, W. S.; Rakar, S.; Robb, L.; Farley, A.; Willson, T. A.; Zhang, J.-G.; Hartley, L.; Kikuchi, Y.; Kojima, T.; Nomura, H.; Hasegawa, M.; Maeda, M.; Fabri, L.; Jachno, K.; Nash, A.
- [54817] Further studies establishing the function and utilities of CRLF1 are found in John Hopkins OMIM database record ID 604237, and in cited publications numbered 5176-5177 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Enolase 2, (gamma, neuronal) (ENO2, Accession NM\_001975) is another VGAM1613 host target gene. ENO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ENO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ENO2 BINDING SITE, designated SEQ ID:7705, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54818] Another function of VGAM1613 is therefore inhibition of Enolase 2, (gamma, neuronal) (ENO2, Accession NM\_001975), a gene which converts 2-phospho-D-glycerate to phosphoenolpyruvate in glycolysis. Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENO2. The function of ENO2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1151. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106) is another VGAM1613 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ

ID:33900, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54819] Another function of VGAM1613 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Sub-family S, Member 2 (KCNS2, Accession XM\_043106), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2. The function of KCNS2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. Matrix Metalloproteinase 14 (membrane-inserted) (MMP14, Accession NM\_004995) is another VGAM1613 host target gene. MMP14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MMP14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP14 BINDING SITE, designated SEQ ID:11435, to the nucleotide sequence of VGAM1613 RNA, herein design-

nated VGAM RNA, also designated SEQ ID:4324.

[54820] Another function of VGAM1613 is therefore inhibition of Matrix Metalloproteinase 14 (membrane-inserted) (MMP14, Accession NM\_004995). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MMP14. FLJ14753 (Accession NM\_032558) is another VGAM1613 host target gene. FLJ14753 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14753, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14753 BINDING SITE, designated SEQ ID:26285, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54821] Another function of VGAM1613 is therefore inhibition of FLJ14753 (Accession NM\_032558). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14753. KIAA0229 (Accession XM\_166478) is another VGAM1613 host target gene. KIAA0229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0229 BINDING SITE, designated SEQ ID:44397, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54822] Another function of VGAM1613 is therefore inhibition of KIAA0229 (Accession XM\_166478). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0229. KIAA0537 (Accession NM\_014840) is another VGAM1613 host target gene. KIAA0537 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0537 BINDING SITE, designated SEQ ID:16865, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54823] Another function of VGAM1613 is therefore inhibition of KIAA0537 (Accession NM\_014840). Accordingly, utilities

of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0537. MGC20235 (Accession NM\_145041) is another VGAM1613 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29664, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54824] Another function of VGAM1613 is therefore inhibition of MGC20235 (Accession NM\_145041). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638) is another VGAM1613 host target gene. SEMA4G BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA4G, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE, designated SEQ ID:45410, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54825] Another function of VGAM1613 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. Vesicular Inhibitory Amino Acid Transporter (VIAAT, Accession NM\_080552) is another VGAM1613 host target gene. VIAAT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by VIAAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VIAAT BINDING SITE, designated SEQ ID:27884, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54826] Another function of VGAM1613 is therefore inhibition of

Vesicular Inhibitory Amino Acid Transporter (VIAAT, Accession NM\_080552). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VIAAT. LOC145989 (Accession XM\_004815) is another VGAM1613 host target gene. LOC145989 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145989 BINDING SITE, designated SEQ ID:29948, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54827] Another function of VGAM1613 is therefore inhibition of LOC145989 (Accession XM\_004815). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145989. LOC148946 (Accession XM\_097557) is another VGAM1613 host target gene. LOC148946 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC148946, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148946 BINDING SITE, designated SEQ ID:40938, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54828] Another function of VGAM1613 is therefore inhibition of LOC148946 (Accession XM\_097557). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148946. LOC151127 (Accession XM\_087104) is another VGAM1613 host target gene. LOC151127 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151127 BINDING SITE, designated SEQ ID:39060, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54829] Another function of VGAM1613 is therefore inhibition of LOC151127 (Accession XM\_087104). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151127. LOC201175 (Accession XM\_113915) is another VGAM1613 host target gene. LOC201175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201175 BINDING SITE, designated SEQ ID:42533, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54830] Another function of VGAM1613 is therefore inhibition of LOC201175 (Accession XM\_113915). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201175. LOC220558 (Accession XM\_165930) is another VGAM1613 host target gene. LOC220558 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220558 BINDING SITE, designated SEQ ID:43804, to the nucleotide sequence of VGAM1613 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4324.

[54831] Another function of VGAM1613 is therefore inhibition of LOC220558 (Accession XM\_165930). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220558. LOC221250 (Accession XM\_166301) is another VGAM1613 host target gene. LOC221250 BINDING SITE1 and LOC221250 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC221250, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221250 BINDING SITE1 and LOC221250 BINDING SITE2, designated SEQ ID:44118 and SEQ ID:44119 respectively, to the nucleotide sequence of VGAM1613 RNA, herein designated VGAM RNA, also designated SEQ ID:4324.

[54832] Another function of VGAM1613 is therefore inhibition of LOC221250 (Accession XM\_166301). Accordingly, utilities of VGAM1613 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 1614 (VGAM1614) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54833] VGAM1614 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1614 was detected is described hereinabove with reference to Figs. 1–8.

[54834] VGAM1614 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54835] VGAM1614 gene encodes a VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1614 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1614 precursor RNA is designated SEQ ID:1600, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1600 is located at position 6443 relative to the

genome of Chimpanzee Cytomegalovirus.

[54836] VGAM1614 precursor RNA folds onto itself, forming VGAM1614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54837] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1614 folded precursor RNA into VGAM1614 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM1614 RNA is designated SEQ ID:4325, and is provided hereinbelow with reference to the sequence listing part.

[54838] VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1614 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54839] VGAM1614 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1614 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1614 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54840] The complementary binding of VGAM1614 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1614 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1614 host target RNA into VGAM1614 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54841] It is appreciated that VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1614 host target genes. The mRNA of each one of this plurality of VGAM1614 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1614 RNA, herein designated VGAM RNA, and which when bound by VGAM1614 RNA causes inhibition of translation of respective one or more VGAM1614 host target proteins.

[54842] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1614 gene, herein designated VGAM GENE, on one or more VGAM1614 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54843] It is yet further appreciated that a function of VGAM1614 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utili-

ties, of VGAM1614 correlate with, and may be deduced from, the identity of the host target genes which VGAM1614 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54844] Nucleotide sequences of the VGAM1614 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1614 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1614 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1614 are further described hereinbelow with reference to Table 1.

[54845] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1614 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1614 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54846] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1614 gene, herein designated VGAM is inhibition of expression of VGAM1614 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1614 correlate with, and may be deduced

from, the identity of the target genes which VGAM1614 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54847] ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933) is a VGAM1614 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32514, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54848] A function of VGAM1614 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM\_036933). Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. PRV1 (Accession XM\_056490) is another VGAM1614 host target gene. PRV1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRV1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of PRV1 BINDING SITE, designated SEQ ID:36398, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54849] Another function of VGAM1614 is therefore inhibition of PRV1 (Accession XM\_056490), a gene which may function as a hematopoietic receptor. Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRV1. The function of PRV1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM778.C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910) is another VGAM1614 host target gene. C1QTNF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF6 BINDING SITE, designated SEQ ID:25657, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54850] Another function of VGAM1614 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 6 (C1QTNF6, Accession NM\_031910). Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF6. FLJ10726 (Accession NM\_018195) is another VGAM1614 host target gene. FLJ10726 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10726, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10726 BINDING SITE, designated SEQ ID:20057, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54851] Another function of VGAM1614 is therefore inhibition of FLJ10726 (Accession NM\_018195). Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10726. LOC145854 (Accession XM\_085259) is another VGAM1614 host target gene. LOC145854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145854, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145854 BINDING SITE, designated SEQ ID:38007, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54852] Another function of VGAM1614 is therefore inhibition of LOC145854 (Accession XM\_085259). Accordingly, utilities of VGAM1614 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145854. LOC157273 (Accession XM\_098743) is another VGAM1614 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41783, to the nucleotide sequence of VGAM1614 RNA, herein designated VGAM RNA, also designated SEQ ID:4325.

[54853] Another function of VGAM1614 is therefore inhibition of LOC157273 (Accession XM\_098743). Accordingly, utilities of VGAM1614 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with LOC157273. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1615 (VGAM1615) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54854] VGAM1615 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1615 was detected is described hereinabove with reference to Figs. 1–8.

[54855] VGAM1615 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54856] VGAM1615 gene encodes a VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1615 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1615 precursor RNA is desig-

nated SEQ ID:1601, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1601 is located at position 1492 relative to the genome of Chimpanzee Cytomegalovirus.

- [54857] VGAM1615 precursor RNA folds onto itself, forming VGAM1615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.
- [54858] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1615 folded precursor RNA into VGAM1615 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM1615 RNA is designated SEQ ID:4326, and is provided hereinbelow with reference to the sequence

listing part.

[54859] VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1615 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54860] VGAM1615 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1615 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1615 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54861] The complementary binding of VGAM1615 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1615 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1615 host target RNA into VGAM1615 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54862] It is appreciated that VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1615 host target genes. The mRNA of each one of this plurality of VGAM1615 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1615 RNA, herein designated VGAM

RNA, and which when bound by VGAM1615 RNA causes inhibition of translation of respective one or more VGAM1615 host target proteins.

[54863] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1615 gene, herein designated VGAM GENE, on one or more VGAM1615 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54864] It is yet further appreciated that a function of VGAM1615 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM1615 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1615 correlate with, and may be deduced from, the identity of the host target genes which VGAM1615 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54865] Nucleotide sequences of the VGAM1615 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1615 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1615 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1615 are further described hereinbelow with reference to Table 1.

[54866] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1615 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1615 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54867] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1615 gene, herein designated VGAM is

inhibition of expression of VGAM1615 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1615 correlate with, and may be deduced from, the identity of the target genes which VGAM1615 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54868] Bone Morphogenetic Protein 6 (BMP6, Accession NM\_001718) is a VGAM1615 host target gene. BMP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BMP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMP6 BINDING SITE, designated SEQ ID:7453, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54869] A function of VGAM1615 is therefore inhibition of Bone Morphogenetic Protein 6 (BMP6, Accession NM\_001718), a gene which induces cartilage and bone formation. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMP6. The function of BMP6 and its association with various diseases and clinical conditions, has

been established by previous studies, as described herein above with reference to VGAM233. Cold Shock Domain Protein A (CSDA, Accession NM\_003651) is another VGAM1615 host target gene. CSDA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CSDA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSDA BINDING SITE, designated SEQ ID:9727, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54870] Another function of VGAM1615 is therefore inhibition of Cold Shock Domain Protein A (CSDA, Accession NM\_003651), a gene which binds to the gm-csf promoter and seems to act as a repressor. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSDA. The function of CSDA has been established by previous studies. To identify cDNAs encoding DNA-binding proteins (DBPs), Sakura et al. (1988) screened a human placenta cDNA expression library with DNA fragments containing either the human epidermal growth factor receptor

(EGFR; 131550) enhancer or the human c-erbB2 (OMIM Ref. No. 164870) promoter. They isolated cDNAs encoding DBPA and DBPB (OMIM Ref. No. 154030). The DBPA cDNAs consisted of 2 forms that differ by an internal 207-bp deletion. Northern blot analysis of HeLa cell RNA detected a major 2.5-kb DBPA transcript and a minor 2.3-kb DBPA transcript. The deduced DBPA and DBPB proteins share a central region in which 100 of 109 amino acids are identical between the 2 proteins. Kudo et al. (1995) isolated full-length human cDNAs encoding DBPA and DBPB by screening for proteins that bind to the human leukosialin (OMIM Ref. No. 182160) promoter. The deduced 342-amino acid DBPA protein has a cold-shock domain and a DNA-binding domain. The authors isolated the DBPA genomic sequence and found that it contains 10 exons spanning 24 kb; exon 6, which encodes 69 amino acids, is alternatively spliced. Northern blot analysis of human tissues demonstrated highest levels of DBPA transcription in skeletal muscle and heart. Immunofluorescence detected DBPA protein expression in both the cytoplasm and nucleus of HeLa cells

[54871] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [54872] Sakura, H.; Maekawa, T.; Imamoto, F.; Yasuda, K.; Ishii, S. : Two human genes isolated by a novel method encode DNA-binding proteins containing a common region of homology. *Gene* 73: 499–507, 1988. ; and
- [54873] Kudo, S.; Mattei, M.–G.; Fukuda, M. : Characterization of the gene for dbpA, a family member of the nucleic-acid-binding proteins containing a cold-shock domain. *Europ. J. Biochem.* 231:.
- [54874] Further studies establishing the function and utilities of CSDA are found in John Hopkins OMIM database record ID 603437, and in cited publications numbered 3794–3796 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Engrailed Homolog 1 (EN1, Accession NM\_001426) is another VGAM1615 host target gene. EN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN1 BINDING SITE, designated SEQ ID:7141, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ

ID:4326.

[54875] Another function of VGAM1615 is therefore inhibition of Engrailed Homolog 1 (EN1, Accession NM\_001426), a gene which is a member of the homeodomain family of DNA binding proteins; may regulate gene expression, morphogenesis, and differentiation;. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EN1. The function of EN1 has been established by previous studies. In *Drosophila*, the 'engrailed' (en) gene plays an important role during development in segmentation, where it is required for the formation of posterior compartments. Expression studies have suggested that en may also function early in organizing the preblastoderm and later in neurogenesis (Logan et al., 1992). En encodes a homeodomain-containing protein that can function as a transcription factor. Logan et al. (1989) isolated the human homologs of the mouse homeo box-containing genes En1 and En2 (OMIM Ref. No. 131310), which show homology to the *Drosophila* en gene. Logan et al. (1992) isolated human and chicken genomic clones of the EN1 and EN2 genes. As in mouse, the predicted coding region of the human and chicken EN1 genes is interrupted by a

single intron. The deduced 392-amino acid human EN1 protein is 95% identical to mouse En1. By sequence analysis, the authors determined that En proteins from various species contain 5 distinct conserved subregions. The related mouse genes En1 and En2 are expressed from the 1- and approximately 5-somite stages, respectively, in a similar presumptive midhindbrain domain. However, mutations in En1 and En2 produced different phenotypes: En1 mutant mice die at birth with a large midhindbrain deletion, whereas En2 mutants survive with cerebellar defects. To determine whether these contrasting phenotypes reflect differences in temporal expression or biochemical activity of the En proteins, Hanks et al. (1995) replaced En1 coding sequences with En2 sequences in transgenic mice by gene targeting. The En2 sequences rescued all En1 mutant defects, demonstrating that the difference between En1 and En2 stems from their divergent expression patterns. Wurst et al. (1994) generated mice homozygous for a targeted deletion of the En1 homeobox. En1 mutant mice died shortly after birth and exhibited multiple developmental defects. The pattern of defects suggested a cell-autonomous role for En1 in generation and/or survival of midhindbrain precursor cells and also a non-

cell-autonomous role in signaling normal development of the limbs and possibly sternum. Loomis et al. (1996) analyzed the effects of an induced null mutation in the mouse engrailed-1 gene on ventral limb patterning. That the gene is essential was indicated by the finding that the null mice showed dorsal transformations of ventral paw structures, as well as subtle alterations along the proximal-distal limb axis. For a review of the role of this gene in limb development, see Johnson and Tabin (1997). Martin et al. (1990) mapped the En1 gene to mouse chromosome 1, approximately 0.28 cM distal to the 'dominant hemimelia' (Dh) gene, and the En2 gene to mouse chromosome 5, approximately 1.1 cM proximal to the 'hemimelic extra-toes' (Hx) gene. They excluded both of these genes as the site of the mutations responsible for Dh and Hx. They suggested that En1/Dh and En2/Hx represent paralogous linkage groups that evolved following duplication of a common ancestral chromosome segment. By Southern analysis of mouse-human somatic cell hybrids, Logan et al. (1989) mapped the human EN1 gene to chromosome 2. Using a mapping panel of rodent/human cell hybrids containing different regions of chromosome 2 and a lymphoblastoid cell line with an interstitial deletion,

del(2)(q21–q23.2), Kohler et al. (1993) refined the regional assignment of EN1 to 2q13–q21. They stated that this increased to 22 the number of known genes on 2q that have homologs in the proximal region of mouse chromosome 1. By fluorescence in situ hybridization, Matsui et al. (1993) further refined the EN1 gene map position to 2q14.

[54876] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54877] Hanks, M.; Wurst, W.; Anson–Cartwright, L.; Auerbach, A. B.; Joyner, A. L. : Rescue of the En–1 mutant phenotype by replacement of En–1 with En–2. Science 269: 679–682, 1995. ; and

[54878] Johnson, R. L.; Tabin, C. J. : Molecular models for vertebrate limb development. Cell 90: 979–990, 1997.

[54879] Further studies establishing the function and utilities of EN1 are found in John Hopkins OMIM database record ID 131290, and in cited publications numbered 2603–2611 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM\_004473) is another VGAM1615 host target gene.

FOX E1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FOX E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOX E1 BINDING SITE, designated SEQ ID:10781, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54880] Another function of VGAM1615 is therefore inhibition of Forkhead Box E1 (thyroid transcription factor 2) (FOX E1, Accession NM\_004473). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOX E1. Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM\_000635) is another VGAM1615 host target gene. RFX2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RFX2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX2 BINDING SITE, designated SEQ ID:6271, to the nucleotide sequence of VGAM1615 RNA, herein

designated VGAM RNA, also designated SEQ ID:4326.

[54881] Another function of VGAM1615 is therefore inhibition of Regulatory Factor X, 2 (influences HLA class II expression) (RFX2, Accession NM\_000635), a gene which acts as a dimer to regulate the expression of many genes. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX2. The function of RFX2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM622. RAR-related Orphan Receptor B (RORB, Accession NM\_006914) is another VGAM1615 host target gene. RORB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RORB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RORB BINDING SITE, designated SEQ ID:13786, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54882] Another function of VGAM1615 is therefore inhibition of RAR-related Orphan Receptor B (RORB, Accession

NM\_006914), a gene which is an orphan nuclear receptor. Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RORB. The function of RORB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178. Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281) is another VGAM1615 host target gene. SCN1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN1A BINDING SITE, designated SEQ ID:42833, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54883] Another function of VGAM1615 is therefore inhibition of Sodium Channel, Voltage-gated, Type I, Alpha Polypeptide (SCN1A, Accession XM\_114281). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN1A.

Cyclin I (CCNI, Accession NM\_006835) is another VGAM1615 host target gene. CCNI BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CCNI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNI BINDING SITE, designated SEQ ID:13713, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54884] Another function of VGAM1615 is therefore inhibition of Cyclin I (CCNI, Accession NM\_006835). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNI. FLJ10099 (Accession NM\_017994) is another VGAM1615 host target gene. FLJ10099 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10099, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10099 BINDING SITE, designated SEQ ID:19725, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM

RNA, also designated SEQ ID:4326.

[54885] Another function of VGAM1615 is therefore inhibition of FLJ10099 (Accession NM\_017994). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10099. FLJ10350 (Accession XM\_170946) is another VGAM1615 host target gene. FLJ10350 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10350 BINDING SITE, designated SEQ ID:45730, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54886] Another function of VGAM1615 is therefore inhibition of FLJ10350 (Accession XM\_170946). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10350. FLJ10846 (Accession NM\_018241) is another VGAM1615 host target gene. FLJ10846 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10846, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:20198, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54887] Another function of VGAM1615 is therefore inhibition of FLJ10846 (Accession NM\_018241). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846. KIAA1655 (Accession XM\_039442) is another VGAM1615 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33086, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54888] Another function of VGAM1615 is therefore inhibition of KIAA1655 (Accession XM\_039442). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA1655. MAGE-E1 (Accession NM\_030801) is another VGAM1615 host target gene. MAGE-E1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAGE-E1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGE-E1 BINDING SITE, designated SEQ ID:25105, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54889] Another function of VGAM1615 is therefore inhibition of MAGE-E1 (Accession NM\_030801). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGE-E1. MGC15631 (Accession NM\_032753) is another VGAM1615 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26492, to

the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54890] Another function of VGAM1615 is therefore inhibition of MGC15631 (Accession NM\_032753). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. LOC143920 (Accession XM\_084658) is another VGAM1615 host target gene. LOC143920 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143920, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143920 BINDING SITE, designated SEQ ID:37640, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54891] Another function of VGAM1615 is therefore inhibition of LOC143920 (Accession XM\_084658). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143920. LOC164397 (Accession XM\_092780) is another VGAM1615 host target gene. LOC164397 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC164397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164397 BINDING SITE, designated SEQ ID:40151, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54892] Another function of VGAM1615 is therefore inhibition of LOC164397 (Accession XM\_092780). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164397. LOC220549 (Accession XM\_167521) is another VGAM1615 host target gene. LOC220549 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220549 BINDING SITE, designated SEQ ID:44650, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54893] Another function of VGAM1615 is therefore inhibition of LOC220549 (Accession XM\_167521). Accordingly, utilities

of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220549. LOC220558 (Accession XM\_165930) is another VGAM1615 host target gene. LOC220558 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220558 BINDING SITE, designated SEQ ID:43805, to the nucleotide sequence of VGAM1615 RNA, herein designated VGAM RNA, also designated SEQ ID:4326.

[54894] Another function of VGAM1615 is therefore inhibition of LOC220558 (Accession XM\_165930). Accordingly, utilities of VGAM1615 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220558. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1616 (VGAM1616) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54895] VGAM1616 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1616 was detected is described hereinabove with reference to Figs. 1-8.

[54896] VGAM1616 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Chimpanzee Cytomegalovirus. VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54897] VGAM1616 gene encodes a VGAM1616 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1616 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1616 precursor RNA is designated SEQ ID:1602, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1602 is located at position 2891 relative to the genome of Chimpanzee Cytomegalovirus.

[54898] VGAM1616 precursor RNA folds onto itself, forming VGAM1616 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54899] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1616 folded precursor RNA into VGAM1616 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1616 RNA is designated SEQ ID:4327, and is provided hereinbelow with reference to the sequence listing part.

[54900] VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1616 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[54901] VGAM1616 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1616 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1616 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54902] The complementary binding of VGAM1616 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1616 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1616 host target RNA into VGAM1616 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54903] It is appreciated that VGAM1616 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1616 host target genes. The mRNA of each one of this plurality of VGAM1616 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1616 RNA, herein designated VGAM RNA, and which when bound by VGAM1616 RNA causes inhibition of translation of respective one or more VGAM1616 host target proteins.

[54904] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1616 gene, herein designated VGAM GENE, on one or more VGAM1616 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54905] It is yet further appreciated that a function of VGAM1616 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of viral infection by Chimpanzee Cytomegalovirus. Specific functions, and accordingly utilities, of VGAM1616 correlate with, and may be deduced from, the identity of the host target genes which VGAM1616 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54906] Nucleotide sequences of the VGAM1616 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1616 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1616 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1616 are further  
described hereinbelow with reference to Table 1.

[54907] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1616 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1616 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54908] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1616 gene, herein designated VGAM is  
inhibition of expression of VGAM1616 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1616 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1616  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54909] A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession  
NM\_007203) is a VGAM1616 host target gene. AKAP2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP2 BINDING SITE, designated SEQ ID:14057, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54910] A function of VGAM1616 is therefore inhibition of A Kinase (PRKA) Anchor Protein 2 (AKAP2, Accession NM\_007203), a gene which binds to regulatory subunit (rii) of protein kinase a. Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP2. The function of AKAP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Growth Hormone Receptor (GHR, Accession NM\_000163) is another VGAM1616 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5672, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54911] Another function of VGAM1616 is therefore inhibition of Growth Hormone Receptor (GHR, Accession NM\_000163). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092) is another VGAM1616 host target gene. ICOS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ICOS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ICOS BINDING SITE, designated SEQ ID:14387, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54912] Another function of VGAM1616 is therefore inhibition of Inducible T-cell Co-stimulator (ICOS, Accession NM\_012092), a gene which forms homodimers and functions as an inducible T-cell co-stimulator. Accordingly,

utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ICOS. The function of ICOS and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18. Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM\_003257) is another VGAM1616 host target gene. TJP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:9263, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54913] Another function of VGAM1616 is therefore inhibition of Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM\_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM95. Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082) is another VGAM1616 host target gene. ARHGAP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP5 BINDING SITE, designated SEQ ID:37818, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54914] Another function of VGAM1616 is therefore inhibition of Rho GTPase Activating Protein 5 (ARHGAP5, Accession XM\_085082). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP5. FLJ12960 (Accession NM\_024638) is another VGAM1616 host target gene. FLJ12960 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12960 BINDING SITE, designated SEQ ID:23915, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54915] Another function of VGAM1616 is therefore inhibition of FLJ12960 (Accession NM\_024638). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12960. KIAA1762 (Accession XM\_033370) is another VGAM1616 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:31909, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54916] Another function of VGAM1616 is therefore inhibition of KIAA1762 (Accession XM\_033370). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1762. MGC15482 (Accession NM\_032875) is another VGAM1616 host target gene. MGC15482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15482 BINDING SITE, designated SEQ ID:26695, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54917] Another function of VGAM1616 is therefore inhibition of MGC15482 (Accession NM\_032875). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15482. LOC124045 (Accession XM\_071873) is another VGAM1616 host target gene. LOC124045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124045 BINDING SITE, designated SEQ ID:37440, to the nucleotide sequence of VGAM1616 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4327.

[54918] Another function of VGAM1616 is therefore inhibition of LOC124045 (Accession XM\_071873). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124045. LOC143465 (Accession XM\_096430) is another VGAM1616 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40362, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54919] Another function of VGAM1616 is therefore inhibition of LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC203378 (Accession XM\_117541) is another VGAM1616 host target gene. LOC203378 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203378, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203378 BINDING SITE, designated SEQ ID:43550, to the nucleotide sequence of VGAM1616 RNA, herein designated VGAM RNA, also designated SEQ ID:4327.

[54920] Another function of VGAM1616 is therefore inhibition of LOC203378 (Accession XM\_117541). Accordingly, utilities of VGAM1616 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203378. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1617 (VGAM1617) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54921] VGAM1617 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1617 was detected is described hereinabove with reference to Figs. 1-8.

[54922] VGAM1617 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D.

VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54923] VGAM1617 gene encodes a VGAM1617 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1617 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1617 precursor RNA is designated SEQ ID:1603, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1603 is located at position 10492 relative to the genome of Fowl Adenovirus D.

[54924] VGAM1617 precursor RNA folds onto itself, forming VGAM1617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54925] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM1617 folded precursor RNA into VGAM1617 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1617 RNA is designated SEQ ID:4328, and is provided hereinbelow with reference to the sequence listing part.

[54926] VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1617 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54927] VGAM1617 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM1617 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1617 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54928] The complementary binding of VGAM1617 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1617 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1617 host target RNA into VGAM1617 host target protein,

herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54929] It is appreciated that VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1617 host target genes. The mRNA of each one of this plurality of VGAM1617 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1617 RNA, herein designated VGAM RNA, and which when bound by VGAM1617 RNA causes inhibition of translation of respective one or more VGAM1617 host target proteins.

[54930] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1617 gene, herein designated VGAM GENE, on one or more VGAM1617 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54931] It is yet further appreciated that a function of VGAM1617 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1617 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1617 correlate with, and may be deduced from, the identity of the host target genes which VGAM1617 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54932] Nucleotide sequences of the VGAM1617 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1617 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1617 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1617 are further described hereinbelow with reference to Table 1.

[54933] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1617 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1617 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54934] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1617 gene, herein designated VGAM is inhibition of expression of VGAM1617 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1617 correlate with, and may be deduced from, the identity of the target genes which VGAM1617 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54935] LOC257463 (Accession XM\_048605) is a VGAM1617 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35208, to the nucleotide sequence of

VGAM1617 RNA, herein designated VGAM RNA, also designated SEQ ID:4328.

[54936] A function of VGAM1617 is therefore inhibition of LOC257463 (Accession XM\_048605). Accordingly, utilities of VGAM1617 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1618 (VGAM1618) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54937] VGAM1618 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1618 was detected is described hereinabove with reference to Figs. 1–8.

[54938] VGAM1618 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54939] VGAM1618 gene encodes a VGAM1618 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1618 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1618 precursor RNA is designated SEQ ID:1604, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1604 is located at position 5025 relative to the genome of Fowl Adenovirus D.

[54940] VGAM1618 precursor RNA folds onto itself, forming VGAM1618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54941] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1618 folded precursor RNA into VGAM1618 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1618 RNA is designated SEQ ID:4329, and is provided hereinbelow with reference to the sequence listing part.

[54942] VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1618 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54943] VGAM1618 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1618 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1618 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54944] The complementary binding of VGAM1618 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1618 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1618 host target RNA into VGAM1618 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54945] It is appreciated that VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM1618 host target genes. The mRNA of each one of this plurality of VGAM1618 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1618 RNA, herein designated VGAM RNA, and which when bound by VGAM1618 RNA causes inhibition of translation of respective one or more VGAM1618 host target proteins.

[54946] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1618 gene, herein designated VGAM GENE, on one or more VGAM1618 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[54947] It is yet further appreciated that a function of VGAM1618 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1618 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1618 correlate with, and may be deduced from, the identity of the host target genes which VGAM1618 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54948] Nucleotide sequences of the VGAM1618 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1618 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1618 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1618 are further described hereinbelow with reference to Table 1.

[54949] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1618 host target RNA, and schematic representation of the complementarity of each

of these host target binding sites to VGAM1618 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54950] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1618 gene, herein designated VGAM is inhibition of expression of VGAM1618 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1618 correlate with, and may be deduced from, the identity of the target genes which VGAM1618 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54951] Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM\_014837) is a VGAM1618 host target gene. C1orf16 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf16, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf16 BINDING SITE, designated SEQ ID:16855, to the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, also designated SEQ ID:4329.

[54952] A function of VGAM1618 is therefore inhibition of Chro-

Chromosome 1 Open Reading Frame 16 (C1orf16, Accession NM\_014837). Accordingly, utilities of VGAM1618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf16. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385) is another VGAM1618 host target gene. C5orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:26182, to the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, also designated SEQ ID:4329.

[54953] Another function of VGAM1618 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385). Accordingly, utilities of VGAM1618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. DKFZP586J0619 (Accession XM\_088280) is another VGAM1618 host target gene. DKFZP586J0619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586J0619, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586J0619 BINDING SITE, designated SEQ ID:39580, to the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, also designated SEQ ID:4329.

[54954] Another function of VGAM1618 is therefore inhibition of DKFZP586J0619 (Accession XM\_088280). Accordingly, utilities of VGAM1618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586J0619. LOC161244 (Accession XM\_101700) is another VGAM1618 host target gene. LOC161244 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161244 BINDING SITE, designated SEQ ID:42107, to the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, also designated SEQ ID:4329.

[54955] Another function of VGAM1618 is therefore inhibition of LOC161244 (Accession XM\_101700). Accordingly, utilities

of VGAM1618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161244. LOC255718 (Accession XM\_174148) is another VGAM1618 host target gene. LOC255718 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255718 BINDING SITE, designated SEQ ID:46580, to the nucleotide sequence of VGAM1618 RNA, herein designated VGAM RNA, also designated SEQ ID:4329.

[54956] Another function of VGAM1618 is therefore inhibition of LOC255718 (Accession XM\_174148). Accordingly, utilities of VGAM1618 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255718. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1619 (VGAM1619) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54957] VGAM1619 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1619 was detected is described hereinabove with reference to Figs. 1–8.

[54958] VGAM1619 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54959] VGAM1619 gene encodes a VGAM1619 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1619 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1619 precursor RNA is designated SEQ ID:1605, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1605 is located at position 4810 relative to the genome of Fowl Adenovirus D.

[54960] VGAM1619 precursor RNA folds onto itself, forming VGAM1619 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54961] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1619 folded precursor RNA into VGAM1619 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM1619 RNA is designated SEQ ID:4330, and is provided hereinbelow with reference to the sequence listing part.

[54962] VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1619 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[54963] VGAM1619 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1619 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1619 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54964] The complementary binding of VGAM1619 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1619 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1619 host target RNA into VGAM1619 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54965] It is appreciated that VGAM1619 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1619 host target genes. The mRNA of each one of this plurality of VGAM1619 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1619 RNA, herein designated VGAM RNA, and which when bound by VGAM1619 RNA causes inhibition of translation of respective one or more VGAM1619 host target proteins.

[54966] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1619 gene, herein designated VGAM GENE, on one or more VGAM1619 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54967] It is yet further appreciated that a function of VGAM1619 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1619 correlate with, and may be deduced from, the identity of the host target genes which VGAM1619 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54968] Nucleotide sequences of the VGAM1619 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1619 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1619 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1619 are further  
described hereinbelow with reference to Table 1.

[54969] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1619 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1619 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[54970] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1619 gene, herein designated VGAM is  
inhibition of expression of VGAM1619 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1619 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1619  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[54971] Snail Homolog 1 (Drosophila) (SNAI1, Accession  
NM\_005985) is a VGAM1619 host target gene. SNAI1

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNAI1 BINDING SITE, designated SEQ ID:12607, to the nucleotide sequence of VGAM1619 RNA, herein designated VGAM RNA, also designated SEQ ID:4330.

[54972] A function of VGAM1619 is therefore inhibition of Snail Homolog 1 (Drosophila) (SNAI1, Accession NM\_005985). Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNAI1. PIPPIN (Accession XM\_086825) is another VGAM1619 host target gene. PIPPIN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIPPIN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIPPIN BINDING SITE, designated SEQ ID:38909, to the nucleotide sequence of VGAM1619 RNA, herein designated VGAM RNA, also designated SEQ ID:4330.

[54973] Another function of VGAM1619 is therefore inhibition of PIPPIN (Accession XM\_086825). Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIPPIN. Voltage-dependent Anion Channel 3 (VDAC3, Accession NM\_005662) is another VGAM1619 host target gene. VDAC3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VDAC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VDAC3 BINDING SITE, designated SEQ ID:12203, to the nucleotide sequence of VGAM1619 RNA, herein designated VGAM RNA, also designated SEQ ID:4330.

[54974] Another function of VGAM1619 is therefore inhibition of Voltage-dependent Anion Channel 3 (VDAC3, Accession NM\_005662). Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VDAC3. LOC255452 (Accession XM\_174088) is another VGAM1619 host target gene. LOC255452 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC255452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255452 BINDING SITE, designated SEQ ID:46572, to the nucleotide sequence of VGAM1619 RNA, herein designated VGAM RNA, also designated SEQ ID:4330.

[54975] Another function of VGAM1619 is therefore inhibition of LOC255452 (Accession XM\_174088). Accordingly, utilities of VGAM1619 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255452. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1620 (VGAM1620) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[54976] VGAM1620 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1620 was detected is described hereinabove with reference to Figs. 1-8.

[54977] VGAM1620 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Fowl Adenovirus D. VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[54978] VGAM1620 gene encodes a VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1620 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1620 precursor RNA is designated SEQ ID:1606, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1606 is located at position 9503 relative to the genome of Fowl Adenovirus D.

[54979] VGAM1620 precursor RNA folds onto itself, forming VGAM1620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[54980] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1620 folded precursor RNA into VGAM1620 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM1620 RNA is designated SEQ ID:4331, and is provided hereinbelow with reference to the sequence listing part.

[54981] VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1620 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[54982] VGAM1620 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM1620 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1620 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[54983] The complementary binding of VGAM1620 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1620 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1620

host target RNA into VGAM1620 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[54984] It is appreciated that VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1620 host target genes. The mRNA of each one of this plurality of VGAM1620 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1620 RNA, herein designated VGAM RNA, and which when bound by VGAM1620 RNA causes inhibition of translation of respective one or more VGAM1620 host target proteins.

[54985] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1620 gene, herein designated VGAM GENE, on one or more VGAM1620 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[54986] It is yet further appreciated that a function of VGAM1620 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific functions, and accordingly utilities, of VGAM1620 correlate with, and may be deduced from, the identity of the host target genes which VGAM1620 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[54987] Nucleotide sequences of the VGAM1620 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1620 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1620 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1620 are further

described hereinbelow with reference to Table 1.

[54988] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1620 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1620 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[54989] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1620 gene, herein designated VGAM is inhibition of expression of VGAM1620 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1620 correlate with, and may be deduced from, the identity of the target genes which VGAM1620 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[54990] Isoleucine-tRNA Synthetase (IARS, Accession NM\_013417) is a VGAM1620 host target gene. IARS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IARS BINDING

SITE, designated SEQ ID:15080, to the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, also designated SEQ ID:4331.

[54991] A function of VGAM1620 is therefore inhibition of Isoleucine-tRNA Synthetase (IARS, Accession NM\_013417), a gene which functions in protein biosynthesis. Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IARS. The function of IARS has been established by previous studies. The autoimmune diseases polymyositis and dermatomyositis are a consequence of autoantibodies directed against 1 or more of the aminoacyl-tRNA synthetases with subsequent lymphocytic destruction of myocytes. Nichols et al. (1995) cloned the cDNA for isoleucyl-tRNA synthetase (TRIS, which they referred to as IRS) by using autoantibodies from patients to purify the protein. Partial amino acid sequence was obtained from tryptic peptides and DNA probes were designed and used to screen liver and HeLa cell libraries. The cDNA has a 1,262-amino acid reading frame with significant sequence similarity to isoleucyl-tRNA synthetases from both yeast and Tetrahymena. The predicted protein contains the expected motifs of class-I hydropho-

bic aminoacyl-tRNA synthetases and the human protein has a C-terminal domain not seen in the lower organisms. The human gene can produce 2 alternatively spliced mRNAs based on the use of a 5-prime untranslated exon. Nichols et al. (1995) speculated that the autoantibodies produced in patients may recognize an epitope in this region. Six of 20 human aminoacyl-tRNA synthetases have been identified as targets of autoantibodies in the autoimmune disease polymyositis/dermatomyositis: histidyl-RS (OMIM Ref. No. 142810) on chromosome 5, threonyl-RS (OMIM Ref. No. 187790), also on chromosome 5, alanyl-RS (OMIM Ref. No. 601065) on chromosome 16, glycyl-RS (OMIM Ref. No. 600287) on chromosome 7, isoleucyl-RS, and lysyl-RS (OMIM Ref. No. 601421). By PCR-based analysis of a human/rodent somatic cell hybrid panel, Nichols et al. (1996) assigned IARS to chromosome 9. By fluorescence in situ hybridization analysis, they regionalized the IARS gene to 9q21.

[54992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[54993] Nichols, R. C.; Blinder, J.; Pai, S. I.; Ge, Q.; Targoff, I. N.; Plotz, P. H.; Liu, P. : Assignment of two human autoanti-

gen genes: isoleucyl-tRNA synthetase locates to 9q21 and lysyl-tRNA synthetase locates to 16q23-q24. Genomics 36: 210-213, 1996. ; and

[54994] Nichols, R. C.; Raben, N.; Boerkoel, C. F.; Plotz, P. H. : Human isoleucyl-tRNA synthetase: sequence of the cDNA, alternative mRNA splicing, and the characteristics of an unusually long.

[54995] Further studies establishing the function and utilities of IARS are found in John Hopkins OMIM database record ID 600709, and in cited publications numbered 10047-10048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0795 (Accession NM\_025010) is another VGAM1620 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0795, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24583, to the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, also designated SEQ ID:4331.

[54996] Another function of VGAM1620 is therefore inhibition of

KIAA0795 (Accession NM\_025010). Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. LOC145693 (Accession XM\_085205) is another VGAM1620 host target gene. LOC145693 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145693 BINDING SITE, designated SEQ ID:37922, to the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, also designated SEQ ID:4331.

[54997] Another function of VGAM1620 is therefore inhibition of LOC145693 (Accession XM\_085205). Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145693. LOC254431 (Accession XM\_173024) is another VGAM1620 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:46293, to the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, also designated SEQ ID:4331.

[54998] Another function of VGAM1620 is therefore inhibition of LOC254431 (Accession XM\_173024). Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. LOC90591 (Accession XM\_032811) is another VGAM1620 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31760, to the nucleotide sequence of VGAM1620 RNA, herein designated VGAM RNA, also designated SEQ ID:4331.

[54999] Another function of VGAM1620 is therefore inhibition of LOC90591 (Accession XM\_032811). Accordingly, utilities of VGAM1620 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1621 (VGAM1621) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55000] VGAM1621 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1621 was detected is described hereinabove with reference to Figs. 1–8.

[55001] VGAM1621 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Fowl Adenovirus D. VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55002] VGAM1621 gene encodes a VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1621 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1621 precursor RNA is designated SEQ ID:1607, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence

SEQ ID:1607 is located at position 4619 relative to the genome of Fowl Adenovirus D.

[55003] VGAM1621 precursor RNA folds onto itself, forming VGAM1621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55004] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1621 folded precursor RNA into VGAM1621 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM1621 RNA is designated SEQ ID:4332, and is provided hereinbelow with reference to the sequence listing part.

[55005] VGAM1621 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1621 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55006] VGAM1621 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1621 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1621 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1621 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[55007] The complementary binding of VGAM1621 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1621 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1621 host target RNA into VGAM1621 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55008] It is appreciated that VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1621 host target genes. The mRNA of each one of this plurality of VGAM1621 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1621 RNA, herein designated VGAM RNA, and which when bound by VGAM1621 RNA causes inhibition of translation of respective one or more

VGAM1621 host target proteins.

[55009] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1621 gene, herein designated VGAM GENE, on one or more VGAM1621 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55010] It is yet further appreciated that a function of VGAM1621 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of viral infection by Fowl Adenovirus D. Specific

functions, and accordingly utilities, of VGAM1621 correlate with, and may be deduced from, the identity of the host target genes which VGAM1621 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55011] Nucleotide sequences of the VGAM1621 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1621 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1621 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1621 are further described hereinbelow with reference to Table 1.

[55012] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1621 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1621 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55013] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1621 gene, herein designated VGAM is inhibition of expression of VGAM1621 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM1621 correlate with, and may be deduced from, the identity of the target genes which VGAM1621 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[55014] Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786) is a VGAM1621 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34563, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55015] A function of VGAM1621 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with refer-

ence to VGAM393.Carnitine Acetyltransferase (CRAT, Accession NM\_004003) is another VGAM1621 host target gene. CRAT BINDING SITE1 and CRAT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CRAT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRAT BINDING SITE1 and CRAT BINDING SITE2, designated SEQ ID:10152 and SEQ ID:6407 respectively, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55016] Another function of VGAM1621 is therefore inhibition of Carnitine Acetyltransferase (CRAT, Accession NM\_004003), a gene which catalyzes the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAT. The function of CRAT and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189.DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Acces-

sion NM\_024005) is another VGAM1621 host target gene. DDX3 BINDING SITE1 and DDX3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DDX3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX3 BINDING SITE1 and DDX3 BINDING SITE2, designated SEQ ID:23434 and SEQ ID:7649 respectively, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55017] Another function of VGAM1621 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 3 (DDX3, Accession NM\_024005), a gene which interacts with hepatitis c virus core protein resulting a change in intracellular location. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX3. The function of DDX3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Eukaryotic Translation Initiation Factor 4 Gamma, 1 (EIF4G1, Accession NM\_004953) is another

VGAM1621 host target gene. EIF4G1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EIF4G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G1 BINDING SITE, designated SEQ ID:11397, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55018] Another function of VGAM1621 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 1 (EIF4G1, Accession NM\_004953), a gene which is a Translation initiation factor. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G1. The function of EIF4G1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1403.EphA2 (EPHA2, Accession NM\_004431) is another VGAM1621 host target gene. EPHA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPHA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHA2 BINDING SITE, designated SEQ ID:10716, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55019] Another function of VGAM1621 is therefore inhibition of EphA2 (EPHA2, Accession NM\_004431), a gene which binds to ephrin-a1, -a3, -a4 and -a5. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHA2. The function of EPHA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1289. Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM\_000599) is another VGAM1621 host target gene. IGFBP5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IGFBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGFBP5 BINDING SITE, designated SEQ ID:6202, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA,

also designated SEQ ID:4332.

[55020] Another function of VGAM1621 is therefore inhibition of Insulin-like Growth Factor Binding Protein 5 (IGFBP5, Accession NM\_000599), a gene which either inhibits or stimulates the growth promoting effects of the igfs on cell culture. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGFBP5. The function of IGFBP5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1233. Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507) is another VGAM1621 host target gene. NGFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NGFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NGFR BINDING SITE, designated SEQ ID:8332, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55021] Another function of VGAM1621 is therefore inhibition of

Nerve Growth Factor Receptor (TNFR superfamily, member 16) (NGFR, Accession NM\_002507), a gene which can mediate cell survival as well as cell death of neural cells. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NGFR. The function of NGFR and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM212.P21/Cdc42/Rac1-activated Kinase 1 (STE20 homolog, yeast) (PAK1, Accession NM\_002576) is another VGAM1621 host target gene. PAK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK1 BINDING SITE, designated SEQ ID:8435, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55022] Another function of VGAM1621 is therefore inhibition of P21/Cdc42/Rac1-activated Kinase 1 (STE20 homolog, yeast) (PAK1, Accession NM\_002576), a gene which acti-

vates the Jun N-terminal kinase MAP kinase pathway. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK1. The function of PAK1 has been established by previous studies. PAK1 protein promotes the disassembly of stress fibers and focal adhesions. Sanders et al. (1999) demonstrated that, in baby hamster kidney-21 and HeLa cells expressing constitutively active PAK1, MLCK (OMIM Ref. No. 600922) activity and myosin light-chain phosphorylation were decreased, and cell spreading was inhibited. These results indicated that MLCK is a target for PAK1, and that PAKs may regulate cytoskeletal dynamics by decreasing MLCK activity and myosin light-chain phosphorylation. Parrini et al. (2002) showed that PAK1 forms homodimers in vivo and that its dimerization is regulated by the intracellular level of GTP-CDC42 (OMIM Ref. No. 116952) or GTP-RAC1 (OMIM Ref. No. 602048). The dimerized PAK1 adopts a trans-inhibited conformation: the N-terminal inhibitory portion of one PAK1 molecule in the dimer binds and inhibits the catalytic domain of the other. One GTPase interaction can result in activation of both partners. Another ligand, beta-PIX (OMIM Ref. No. 605477), can stably associate with

dimerized PAK1. Dimerization does not facilitate PAK1 trans-phosphorylation. The authors concluded that the functional significance of dimerization is to allow trans-inhibition. Vadlamudi et al. (2002) identified filamin A (FLNA; 300017) as a binding partner of PAK1 in a yeast 2-hybrid screen of a mammary gland cDNA library. By mutation analysis, they localized the PAK1-binding region in FLNA to tandem repeat 23 in the C terminus, and the FLNA-binding region in PAK1 between amino acids 52 and 132 in the conserved CDC42 (OMIM Ref. No. 116952)/RAC (OMIM Ref. No. 602048)-interacting domain. Endogenous FLNA was phosphorylated by PAK1 on ser2152 following stimulation with physiologic signaling molecules. Following stimulation, FLNA colocalized with PAK1 in membrane ruffles. The ruffle-forming activity of PAK1 was found in FLNA-expressing cells, but not in cells deficient in FLNA.

[55023] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55024] Sanders, L. C.; Matsumura, F.; Bokoch, G. M.; de Lanerolle, P. : Inhibition of myosin light chain kinase by p21-activated kinase. Science 283: 2083-2085, 1999. ; and

[55025] Vadlamudi, R. K.; Li, F.; Adam, L.; Nguyen, D.; Ohta, Y.; Stossel, T. P.; Kumar, R. : Filamin is essential in actin cytoskeletal assembly mediated by p21-activated kinase 1. Nature Cell.

[55026] Further studies establishing the function and utilities of PAK1 are found in John Hopkins OMIM database record ID 602590, and in cited publications numbered 8637-1035, 1039-104 and 7264 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030668) is another VGAM1621 host target gene. PTPRO BINDING SITE1 through PTPRO BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRO, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRO BINDING SITE1 through PTPRO BINDING SITE3, designated SEQ ID:25010, SEQ ID:25019 and SEQ ID:25029 respectively, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55027] Another function of VGAM1621 is therefore inhibition of

Protein Tyrosine Phosphatase, Receptor Type, O (PTPRO, Accession NM\_030668), a gene which may function as a cell contact receptor that mediates and controls cell-cell signals. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRO. The function of PTPRO and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM140. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_139071) is another VGAM1621 host target gene.

SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:29144 and SEQ ID:9046 respectively, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55028] Another function of VGAM1621 is therefore inhibition of

SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1

(SMARCD1, Accession NM\_139071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Chromosome 11

Open Reading Frame 9 (C11orf9, Accession NM\_013279) is another VGAM1621 host target gene. C11orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C11orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf9 BINDING SITE, designated SEQ ID:14944, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55029] Another function of VGAM1621 is therefore inhibition of Chromosome 11 Open Reading Frame 9 (C11orf9, Accession NM\_013279). Accordingly, utilities of VGAM1621 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf9. Centaurin, Gamma 1 (CENTG1, Accession NM\_014770) is another VGAM1621 host target gene. CENTG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CENTG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTG1 BINDING SITE, designated SEQ ID:16566, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55030] Another function of VGAM1621 is therefore inhibition of Centaurin, Gamma 1 (CENTG1, Accession NM\_014770). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTG1. Claudin 6 (CLDN6, Accession NM\_021195) is another VGAM1621 host target gene. CLDN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CLDN6 BINDING SITE, designated SEQ ID:22170, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55031] Another function of VGAM1621 is therefore inhibition of Claudin 6 (CLDN6, Accession NM\_021195). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN6. Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM\_003646) is another VGAM1621 host target gene. DGKZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGKZ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGKZ BINDING SITE, designated SEQ ID:9719, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55032] Another function of VGAM1621 is therefore inhibition of Diacylglycerol Kinase, Zeta 104kDa (DGKZ, Accession NM\_003646). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGKZ. DKFZP586P0123

(Accession XM\_170681) is another VGAM1621 host target gene. DKFZP586P0123 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:45464, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55033] Another function of VGAM1621 is therefore inhibition of DKFZP586P0123 (Accession XM\_170681). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586P0123. Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295) is another VGAM1621 host target gene. EPB41L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EPB41L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPB41L1 BINDING SITE, designated SEQ ID:34944, to the nucleotide

sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55034] Another function of VGAM1621 is therefore inhibition of Erythrocyte Membrane Protein Band 4.1-like 1 (EPB41L1, Accession XM\_047295). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPB41L1. FLJ13102 (Accession NM\_024887) is another VGAM1621 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24343, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55035] Another function of VGAM1621 is therefore inhibition of FLJ13102 (Accession NM\_024887). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. FLJ13840 (Accession NM\_024746) is another VGAM1621 host target gene. FLJ13840 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13840, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13840 BINDING SITE, designated SEQ ID:24081, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55036] Another function of VGAM1621 is therefore inhibition of FLJ13840 (Accession NM\_024746). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13840. FLJ23040 (Accession NM\_025174) is another VGAM1621 host target gene. FLJ23040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23040 BINDING SITE, designated SEQ ID:24808, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55037] Another function of VGAM1621 is therefore inhibition of

FLJ23040 (Accession NM\_025174). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23040. GMPPB (Accession XM\_171044) is another VGAM1621 host target gene. GMPPB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GMPPB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GMPPB BINDING SITE, designated SEQ ID:45813, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55038] Another function of VGAM1621 is therefore inhibition of GMPPB (Accession XM\_171044). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GMPPB. Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814) is another VGAM1621 host target gene. GPA33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPA33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of GPA33 BINDING SITE, designated SEQ ID:12406, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55039] Another function of VGAM1621 is therefore inhibition of Glycoprotein A33 (transmembrane) (GPA33, Accession NM\_005814). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPA33. KIAA0720 (Accession XM\_030970) is another VGAM1621 host target gene. KIAA0720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0720 BINDING SITE, designated SEQ ID:31233, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55040] Another function of VGAM1621 is therefore inhibition of KIAA0720 (Accession XM\_030970). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with KIAA0720. KIAA1257 (Accession XM\_031577) is another VGAM1621 host target gene. KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1257, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1257 BINDING SITE1 and KIAA1257 BINDING SITE2, designated SEQ ID:31432 and SEQ ID:31434 respectively, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55041] Another function of VGAM1621 is therefore inhibition of KIAA1257 (Accession XM\_031577). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1257. KIAA1649 (Accession NM\_032311) is another VGAM1621 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:26106, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55042] Another function of VGAM1621 is therefore inhibition of KIAA1649 (Accession NM\_032311). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1822 (Accession XM\_041566) is another VGAM1621 host target gene. KIAA1822 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1822, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1822 BINDING SITE, designated SEQ ID:33556, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55043] Another function of VGAM1621 is therefore inhibition of KIAA1822 (Accession XM\_041566). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1822. KIAA1853 (Accession XM\_045184) is another VGAM1621 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:34385, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55044] Another function of VGAM1621 is therefore inhibition of KIAA1853 (Accession XM\_045184). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. KIAA1944 (Accession XM\_062545) is another VGAM1621 host target gene. KIAA1944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1944 BINDING SITE, designated SEQ ID:37228, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55045] Another function of VGAM1621 is therefore inhibition of KIAA1944 (Accession XM\_062545). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1944. MGC2477 (Accession NM\_024099) is another VGAM1621 host target gene. MGC2477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE, designated SEQ ID:23545, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55046] Another function of VGAM1621 is therefore inhibition of MGC2477 (Accession NM\_024099). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550) is another VGAM1621 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17816, to the nucleotide sequence of VGAM1621 RNA,

herein designated VGAM RNA, also designated SEQ ID:4332.

[55047] Another function of VGAM1621 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. TSPAN-5 (Accession NM\_005723) is another VGAM1621 host target gene. TSPAN-5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TSPAN-5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSPAN-5 BINDING SITE, designated SEQ ID:12275, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55048] Another function of VGAM1621 is therefore inhibition of TSPAN-5 (Accession NM\_005723). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSPAN-5. VILL (Accession XM\_043435) is another VGAM1621 host target gene. VILL BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by VILL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VILL BINDING SITE, designated SEQ ID:33946, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55049] Another function of VGAM1621 is therefore inhibition of VILL (Accession XM\_043435). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VILL. LOC112616 (Accession NM\_138410) is another VGAM1621 host target gene. LOC112616 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112616, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112616 BINDING SITE, designated SEQ ID:28773, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55050] Another function of VGAM1621 is therefore inhibition of

LOC112616 (Accession NM\_138410). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112616. LOC126528 (Accession XM\_059052) is another VGAM1621 host target gene. LOC126528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126528 BINDING SITE, designated SEQ ID:36843, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55051] Another function of VGAM1621 is therefore inhibition of LOC126528 (Accession XM\_059052). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126528. LOC146268 (Accession XM\_085397) is another VGAM1621 host target gene. LOC146268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146268 BINDING SITE, designated SEQ ID:38122, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55052] Another function of VGAM1621 is therefore inhibition of LOC146268 (Accession XM\_085397). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146268. LOC147165 (Accession XM\_097205) is another VGAM1621 host target gene. LOC147165 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147165 BINDING SITE, designated SEQ ID:40813, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55053] Another function of VGAM1621 is therefore inhibition of LOC147165 (Accession XM\_097205). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147165. LOC153020 (Accession XM\_087578) is an-

other VGAM1621 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153020 BINDING SITE, designated SEQ ID:39355, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55054] Another function of VGAM1621 is therefore inhibition of LOC153020 (Accession XM\_087578). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. LOC222237 (Accession XM\_168592) is another VGAM1621 host target gene. LOC222237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222237 BINDING SITE, designated SEQ ID:45268, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55055] Another function of VGAM1621 is therefore inhibition of LOC222237 (Accession XM\_168592). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222237. LOC253868 (Accession XM\_170975) is another VGAM1621 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45748, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55056] Another function of VGAM1621 is therefore inhibition of LOC253868 (Accession XM\_170975). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. LOC51246 (Accession NM\_016479) is another VGAM1621 host target gene. LOC51246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51246, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51246 BINDING SITE, designated SEQ ID:18578, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55057] Another function of VGAM1621 is therefore inhibition of LOC51246 (Accession NM\_016479). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51246. LOC51667 (Accession NM\_016118) is another VGAM1621 host target gene. LOC51667 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51667 BINDING SITE, designated SEQ ID:18197, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55058] Another function of VGAM1621 is therefore inhibition of LOC51667 (Accession NM\_016118). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51667. LOC92223 (Accession XM\_043674) is another VGAM1621 host target gene. LOC92223 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92223 BINDING SITE, designated SEQ ID:33993, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55059] Another function of VGAM1621 is therefore inhibition of LOC92223 (Accession XM\_043674). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92223. LOC93259 (Accession XM\_050105) is another VGAM1621 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35562, to the nucleotide sequence of VGAM1621 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:4332.

[55060] Another function of VGAM1621 is therefore inhibition of LOC93259 (Accession XM\_050105). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93259. LOC93512 (Accession XM\_051758) is another VGAM1621 host target gene. LOC93512 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93512 BINDING SITE, designated SEQ ID:35877, to the nucleotide sequence of VGAM1621 RNA, herein designated VGAM RNA, also designated SEQ ID:4332.

[55061] Another function of VGAM1621 is therefore inhibition of LOC93512 (Accession XM\_051758). Accordingly, utilities of VGAM1621 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93512. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1622 (VGAM1622) viral gene, which

modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55062] VGAM1622 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1622 was detected is described hereinabove with reference to Figs. 1–8.

[55063] VGAM1622 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55064] VGAM1622 gene encodes a VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1622 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1622 precursor RNA is designated SEQ ID:1608, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1608 is located at position 87319 relative to the genome of Bovine Herpesvirus 4.

[55065] VGAM1622 precursor RNA folds onto itself, forming

VGAM1622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55066] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1622 folded precursor RNA into VGAM1622 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM1622 RNA is designated SEQ ID:4333, and is provided hereinbelow with reference to the sequence listing part.

[55067] VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1622 host target RNA

comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[55068] VGAM1622 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1622 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1622 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55069] The complementary binding of VGAM1622 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1622 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1622 host target RNA into VGAM1622 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55070] It is appreciated that VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1622 host target genes. The mRNA of each one of this plurality of VGAM1622 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1622 RNA, herein designated VGAM RNA, and which when bound by VGAM1622 RNA causes inhibition of translation of respective one or more VGAM1622 host target proteins.

[55071] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM1622 gene, herein designated VGAM GENE, on one or more VGAM1622 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55072] It is yet further appreciated that a function of VGAM1622 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1622 correlate with, and may be deduced from, the identity of the host target genes which VGAM1622 binds and in-

hibits, and the function of these host target genes, as elaborated hereinbelow.

[55073] Nucleotide sequences of the VGAM1622 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1622 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1622 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1622 are further described hereinbelow with reference to Table 1.

[55074] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1622 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1622 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[55075] As mentioned hereinabove with reference to Fig. 1, a function of VGAM1622 gene, herein designated VGAM is inhibition of expression of VGAM1622 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM1622 correlate with, and may be deduced from, the identity of the target genes which VGAM1622 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[55076] Calcium/calmodulin-dependent Protein Kinase IV (CAMK4, Accession NM\_001744) is a VGAM1622 host target gene. CAMK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMK4 BINDING SITE, designated SEQ ID:7483, to the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, also designated SEQ ID:4333.

[55077] A function of VGAM1622 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase IV (CAMK4, Accession NM\_001744), a gene which is a heat-stable, acidic, calmodulin-binding protein. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMK4. The function of CAMK4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM578. Death Effector Domain Containing (DEDD, Accession NM\_032998) is another VGAM1622 host

target gene. DEDD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DEDD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEDD BINDING SITE, designated SEQ ID:26882, to the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, also designated SEQ ID:4333.

[55078] Another function of VGAM1622 is therefore inhibition of Death Effector Domain Containing (DEDD, Accession NM\_032998), a gene which intervenes in apoptosis. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEDD. The function of DEDD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM1189. Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM\_005923) is another VGAM1622 host target gene. MAP3K5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K5, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K5 BINDING SITE, designated SEQ ID:12545, to the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, also designated SEQ ID:4333.

[55079] Another function of VGAM1622 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 5 (MAP3K5, Accession NM\_005923), a gene which phosphorylates and activates two different subgroups of map kinase kinases, mkk4/sek1 and mkk3/mapkk6 (or mkk6). overexpression induces apoptotic cell death. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K5. The function of MAP3K5 has been established by previous studies. Mitogen-activated protein kinase (MAPK) signaling cascades include MAPK or extracellular signal-regulated kinase (ERK), MAPK kinase (MAP2K, also called MKK or MEK), and MAPK kinase kinase (MAP3K, also called MAPKKK or MEKK). MAPKK kinase/MEKK phosphorylates and activates its downstream protein kinase, MAPK kinase/MEK, which in turn activates MAPK. The kinases of these signaling cascades are highly conserved,

and homologs exist in yeast, *Drosophila*, and mammalian cells Ichijo et al. (1997) used a similar cloning strategy to identify a nearly identical MAPKKK cDNA, termed ASK1 for apoptosis signal-regulating kinase. The deduced protein contains 1,375 amino acids, and is most closely related to yeast SSK2 and SSK22, which are upstream regulators of yeast HOG1 MAPK. ASK1 expression complements a yeast mutant lacking functional SSK2 and SSK22. ASK1 also activates MKK3 (OMIM Ref. No. 602315), MKK4 (SEK1), and MKK6 (OMIM Ref. No. 601254). Overexpression of ASK1 induces apoptotic cell death, and ASK1 is activated in cells treated with tumor necrosis factor- $\alpha$  (TNF $\alpha$ ; 191160). Nishitoh et al. (1998) showed that ASK1 interacts with members of the TRAF family and is activated by TRAF2 (OMIM Ref. No. 601895) in the TNF-signaling pathway. After activation by TRAF2, ASK1 activates MKK4, which in turn activates JNK. Thus, ASK1 is a mediator of TRAF2-induced JNK activation. Animal model experiments lend further support to the function of MAP3K5. Using a forward genetic screen of *C. elegans* mutants, Kim et al. (2002) showed that viable worms lacking *esp2* and *esp8*, homologs of the mammalian MAP kinases SEK1 and ASK1, were highly susceptible to and died more rapidly from

both a gram-negative bacterium, *P. aeruginosa*, and a gram-positive organism, *E. faecalis*, than wildtype worms. RNA-interference and biochemical analyses likewise implicated the p38 MAP kinase homolog, *pmk1*, in susceptibility to these pathogens. Kim et al. (2002) concluded that MAP kinase signaling, which is also involved in plant pathogen resistance, is a conserved element in innate metazoan immunity to diverse pathogens.

[55080] It is appreciated that the abovementioned animal model for MAP3K5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[55081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[55082] Kim, D. H.; Feinbaum, R.; Alloing, G.; Emerson, F. E.; Garsin, D. A.; Inoue, H.; Tanaka-Hino, M.; Hisamoto, N.; Matsumoto, K.; Tan, M.-W.; Ausubel, F. M. : A conserved p38 MAP kinase pathway in *Caenorhabditis elegans* innate immunity. *Science* 297: 623-626, 2002. ; and

1998.

[55084] Further studies establishing the function and utilities of MAP3K5 are found in John Hopkins OMIM database record ID 602448, and in cited publications numbered 5869–5871, 10126, 12537, 10348, 1035 and 6315 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prolactin Receptor (PRLR, Accession NM\_000949) is another VGAM1622 host target gene. PRLR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRLR BINDING SITE, designated SEQ ID:6650, to the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, also designated SEQ ID:4333.

[55085] Another function of VGAM1622 is therefore inhibition of Prolactin Receptor (PRLR, Accession NM\_000949), a gene which is a receptor for the anterior pituitary hormone prolactin. Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRLR. The function of PRLR and its association with various diseases and clinical conditions,

has been established by previous studies, as described hereinabove with reference to VGAM80.KIAA0310 (Accession XM\_088459) is another VGAM1622 host target gene. KIAA0310 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0310 BINDING SITE, designated SEQ ID:39711, to the nucleotide sequence of VGAM1622 RNA, herein designated VGAM RNA, also designated SEQ ID:4333.

[55086] Another function of VGAM1622 is therefore inhibition of KIAA0310 (Accession XM\_088459). Accordingly, utilities of VGAM1622 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1623 (VGAM1623) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[55087] VGAM1623 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1623 was detected is described hereinabove with reference to Figs. 1-8.

[55088] VGAM1623 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55089] VGAM1623 gene encodes a VGAM1623 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1623 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1623 precursor RNA is designated SEQ ID:1609, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1609 is located at position 83968 relative to the genome of Bovine Herpesvirus 4.

[55090] VGAM1623 precursor RNA folds onto itself, forming VGAM1623 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the

art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55091] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1623 folded precursor RNA into VGAM1623 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM1623 RNA is designated SEQ ID:4334, and is provided hereinbelow with reference to the sequence listing part.

[55092] VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1623 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated

5`UTR, PROTEIN CODING and 3`UTR respectively.

[55093] VGAM1623 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1623 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1623 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[55094] The complementary binding of VGAM1623 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1623 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1623 host target RNA into VGAM1623 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55095] It is appreciated that VGAM1623 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1623 host target genes. The mRNA of each one of this plurality of VGAM1623 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1623 RNA, herein designated VGAM RNA, and which when bound by VGAM1623 RNA causes inhibition of translation of respective one or more VGAM1623 host target proteins.

[55096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1623 gene, herein designated VGAM GENE, on one or more VGAM1623 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55097] It is yet further appreciated that a function of VGAM1623 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1623 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1623 correlate with, and may be deduced from, the identity of the host target genes which VGAM1623 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55098] Nucleotide sequences of the VGAM1623 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM1623 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM1623 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM1623 are further  
described hereinbelow with reference to Table 1.

[55099] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM1623 host target RNA, and  
schematic representation of the complementarity of each  
of these host target binding sites to VGAM1623 RNA,  
herein designated VGAM RNA, are described hereinbelow  
with reference to Table 2.

[55100] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM1623 gene, herein designated VGAM is  
inhibition of expression of VGAM1623 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM1623 correlate with, and may be deduced  
from, the identity of the target genes which VGAM1623  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[55101] FLJ23323 (Accession NM\_024654) is a VGAM1623 host  
target gene. FLJ23323 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ23323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23323 BINDING SITE, designated SEQ ID:23954, to the nucleotide sequence of VGAM1623 RNA, herein designated VGAM RNA, also designated SEQ ID:4334.

[55102] A function of VGAM1623 is therefore inhibition of FLJ23323 (Accession NM\_024654). Accordingly, utilities of VGAM1623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23323. HSC3 (Accession NM\_145174) is another VGAM1623 host target gene. HSC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSC3 BINDING SITE, designated SEQ ID:29733, to the nucleotide sequence of VGAM1623 RNA, herein designated VGAM RNA, also designated SEQ ID:4334.

[55103] Another function of VGAM1623 is therefore inhibition of

HSC3 (Accession NM\_145174). Accordingly, utilities of VGAM1623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSC3. LOC145623 (Accession XM\_096822) is another VGAM1623 host target gene. LOC145623 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145623, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145623 BINDING SITE, designated SEQ ID:40546, to the nucleotide sequence of VGAM1623 RNA, herein designated VGAM RNA, also designated SEQ ID:4334.

[55104] Another function of VGAM1623 is therefore inhibition of LOC145623 (Accession XM\_096822). Accordingly, utilities of VGAM1623 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145623. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 1624 (VGAM1624) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes

is known in the art.

[55105] VGAM1624 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM1624 was detected is described hereinabove with reference to Figs. 1–8.

[55106] VGAM1624 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Bovine Herpesvirus 4. VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[55107] VGAM1624 gene encodes a VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM1624 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM1624 precursor RNA is designated SEQ ID:1610, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:1610 is located at position 86638 relative to the genome of Bovine Herpesvirus 4.

[55108] VGAM1624 precursor RNA folds onto itself, forming VGAM1624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–

dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[55109] An enzyme complex designated DICER COMPLEX, `dices` the VGAM1624 folded precursor RNA into VGAM1624 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM1624 RNA is designated SEQ ID:4335, and is provided hereinbelow with reference to the sequence listing part.

[55110] VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM1624 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein cod-

ing region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[55111] VGAM1624 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM1624 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM1624 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[55112] The complementary binding of VGAM1624 RNA, herein designated VGAM RNA, to host target binding sites on VGAM1624 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM1624 host target RNA into VGAM1624 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[55113] It is appreciated that VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM1624 host target genes. The mRNA of each one of this plurality of VGAM1624 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM1624 RNA, herein designated VGAM RNA, and which when bound by VGAM1624 RNA causes inhibition of translation of respective one or more VGAM1624 host target proteins.

[55114] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM1624 gene, herein designated VGAM GENE, on one

or more VGAM1624 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[55115] It is yet further appreciated that a function of VGAM1624 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM1624 include diagnosis, prevention and treatment of viral infection by Bovine Herpesvirus 4. Specific functions, and accordingly utilities, of VGAM1624 correlate with, and may be deduced from, the identity of the host target genes which VGAM1624 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[55116] Nucleotide sequences of the VGAM1624 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM1624 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM1624 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM1624 are further described hereinbelow with reference to Table 1.

[55117] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM1624 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM1624 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
